EAL 4 augmented by ALC_FLR.3

Common Criteria
Recognition
Arrangement

The IT product identified in this certificate has been evaluated at an approved evaluation facility using the Common Methodology for IT Security Evaluation (CEM), Version 3.1 for conformance to the Common Criteria for IT Security Evaluation (CC), Version 3.1.

This certificate applies only to the specific version and release of the product in its evaluated configuration and in conjunction with the complete Certification Report.

The evaluation has been conducted in accordance with the provisions of the certification scheme of the German Federal Office for Information Security (BSI) and the conclusions of the evaluation facility in the evaluation technical report are consistent with the evidence adduced.

This certificate is not an endorsement of the IT product by the Federal Office for Information Security or any other organisation that recognises or gives effect to this certificate, and no warranty of the IT product by the Federal Office for Information Security or any other organisation that recognises or gives effect to this certificate, is either expressed or implied.

Bonn, 27 August 2014

For the Federal Office for Information Security

Bernd Kowalski
Head of Department

L.S.

SOGIS Recognition
Agreement

This page is intentionally left blank.

Preliminary Remarks

Under the BSIG¹ Act, the Federal Office for Information Security (BSI) has the task of issuing certificates for information technology products.

Certification of a product is carried out on the instigation of the vendor or a distributor, hereinafter called the sponsor.

A part of the procedure is the technical examination (evaluation) of the product according to the security criteria published by the BSI or generally recognised security criteria.

The evaluation is normally carried out by an evaluation facility recognised by the BSI or by BSI itself.

The result of the certification procedure is the present Certification Report. This report contains among others the certificate (summarised assessment) and the detailed Certification Results.

The Certification Results contain the technical description of the security functionality of the certified product, the details of the evaluation (strength and weaknesses) and instructions for the user.

¹ Act on the Federal Office for Information Security (BSI-Gesetz - BSIG) of 14 August 2009, Bundesgesetzblatt I p. 2821

A Certification

1 Specifications of the Certification Procedure

The certification body conducts the procedure according to the criteria laid down in the following:

- BSIG²
- BSI Certification Ordinance³
- BSI Schedule of Costs⁴
- Special decrees issued by the Bundesministerium des Innern (Federal Ministry of the Interior)
- DIN EN 45011 standard
- BSI certification: Procedural Description (BSI 7125) [3]
- Common Criteria for IT Security Evaluation (CC), Version 3.1⁵ [1]
- Common Methodology for IT Security Evaluation, Version 3.1 [2]
- BSI certification: Application Notes and Interpretation of the Scheme (AIS) [4]

2 Recognition Agreements

In order to avoid multiple certification of the same product in different countries a mutual recognition of IT security certificates - as far as such certificates are based on ITSEC or CC - under certain conditions was agreed.

2.1 European Recognition of ITSEC/CC – Certificates (SOGIS-MRA)

The SOGIS-Mutual Recognition Agreement (SOGIS-MRA) Version 3 became effective in April 2010. It defines the recognition of certificates for IT-Products at a basic recognition level and in addition at higher recognition levels for IT-Products related to certain technical domains only.

The basic recognition level includes Common Criteria (CC) Evaluation Assurance Levels EAL1 to EAL4 and ITSEC Evaluation Assurance Levels E1 to E3 (basic). For higher recognition levels the technical domain Smart card and similar Devices has been defined. It includes assurance levels beyond EAL4 resp. E3 (basic). In addition, certificates issued for Protection Profiles based on Common Criteria are part of the recognition agreement.

² Act on the Federal Office for Information Security (BSI-Gesetz - BSIG) of 14 August 2009, Bundesgesetzblatt I p. 2821

³ Ordinance on the Procedure for Issuance of a Certificate by the Federal Office for Information Security (BSI-Zertifizierungsverordnung, BSIZertV) of 07 July 1992, Bundesgesetzblatt I p. 1230

⁴ Schedule of Cost for Official Procedures of the Bundesamt für Sicherheit in der Informationstechnik (BSI-Kostenverordnung, BSI-KostV) of 03 March 2005, Bundesgesetzblatt I p. 519

⁵ Proclamation of the Bundesministerium des Innern of 12 February 2007 in the Bundesanzeiger dated 23 February 2007, p. 3730

As of September 2011 the new agreement has been signed by the national bodies of Austria, Finland, France, Germany, Italy, The Netherlands, Norway, Spain, Sweden and the United Kingdom. Details on recognition and the history of the agreement can be found at <https://www.bsi.bund.de/zertifizierung>.

The SOGIS-MRA logo printed on the certificate indicates that it is recognised under the terms of this agreement by the nations listed above.

2.2 International Recognition of CC – Certificates (CCRA)

An arrangement (Common Criteria Recognition Arrangement) on the mutual recognition of certificates based on the CC Evaluation Assurance Levels up to and including EAL 4 has been signed in May 2000 (CCRA). It includes also the recognition of Protection Profiles based on the CC.

As of September 2011 the arrangement has been signed by the national bodies of: Australia, Austria, Canada, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, India, Israel, Italy, Japan, Republic of Korea, Malaysia, The Netherlands, New Zealand, Norway, Pakistan, Republic of Singapore, Spain, Sweden, Turkey, United Kingdom, United States of America. The current list of signatory nations and approved certification schemes can be seen on the website: <http://www.commoncriteriaportal.org>.

The Common Criteria Recognition Arrangement logo printed on the certificate indicates that this certification is recognised under the terms of this agreement by the nations listed above.

3 Performance of Evaluation and Certification

The certification body monitors each individual evaluation to ensure a uniform procedure, a uniform interpretation of the criteria and uniform ratings.

The product IBM DB2 Version 11 for z/OS Version 1 Release 13 has undergone the certification procedure at BSI. This is a re-certification based on BSI-DSZ-CC-0622-2012. Specific results from the evaluation process BSI-DSZ-CC-0622-2012 were re-used.

The evaluation of the product IBM DB2 Version 11 for z/OS Version 1 Release 13 was conducted by atsec information security GmbH. The evaluation was completed on 19 August 2014. atsec information security GmbH is an evaluation facility (ITSEF)⁶ recognised by the certification body of BSI.

For this certification procedure the sponsor and applicant is: IBM Corporation.

The product was developed by: IBM Corporation.

The certification is concluded with the comparability check and the production of this Certification Report. This work was completed by the BSI.

4 Validity of the Certification Result

This Certification Report only applies to the version of the product as indicated. The confirmed assurance package is only valid on the condition that

- all stipulations regarding generation, configuration and operation, as given in the following report, are observed,

⁶ Information Technology Security Evaluation Facility

- the product is operated in the environment described, as specified in the following report and in the Security Target.

For the meaning of the assurance levels please refer to the excerpts from the criteria at the end of the Certification Report.

The Certificate issued confirms the assurance of the product claimed in the Security Target at the date of certification. As attack methods evolve over time, the resistance of the certified version of the product against new attack methods needs to be re-assessed. Therefore, the sponsor should apply for the certified product being monitored within the assurance continuity program of the BSI Certification Scheme (e.g. by a re-certification). Specifically, if results of the certification are used in subsequent evaluation and certification procedures, in a system integration process or if a user's risk management needs regularly updated results, it is recommended to perform a re-assessment on a regular e.g. annual basis.

In case of changes to the certified version of the product, the validity can be extended to the new versions and releases, provided the sponsor applies for assurance continuity (i.e. re-certification or maintenance) of the modified product, in accordance with the procedural requirements, and the evaluation does not reveal any security deficiencies.

5 Publication

The product IBM DB2 Version 11 for z/OS Version 1 Release 13 has been included in the BSI list of certified products, which is published regularly (see also Internet: <https://www.bsi.bund.de> and [5]). Further information can be obtained from BSI-Infoline +49 228 9582-111.

Further copies of this Certification Report can be requested from the developer⁷ of the product. The Certification Report may also be obtained in electronic form at the internet address stated above.

B Certification Results

The following results represent a summary of

- the Security Target of the sponsor for the Target of Evaluation,
- the relevant evaluation results from the evaluation facility, and
- complementary notes and stipulations of the certification body.

1 Executive Summary

The Target of Evaluation (TOE) is a combined TOE, consisting of:

- The “IBM z/OS Version 1 Release 13 (z/OS V1R13)” operating system, including the Resource Access Control Facility (RACF) which is used as the evaluated platform
- The “IBM DB2 11 for z/OS” (DB2 11), which is built upon this platform.

The DB2 11 Security Target ([6]) builds on the z/OS Security Target [8], which refers to the evaluated “IBM z/OS Version 1 Release 13” operating system.

DB2 11 is a relational database management system that operates as a subsystem of z/OS. DB2 is implemented by a set of address spaces plus a set of utilities.

The Security Target [6] is the basis for this certification. It is based on the certified Protection Profiles

- Operating System Protection Profile, Version 2.0, 01 June 2010, BSI-CC-PP-0067-2010,
- OSPP Extended Package – Extended Identification and Authentication, Version 2.0, 28 May 2010,
- OSPP Extended Package – Labeled Security, Version 2.0, 28 May 2010 [7].

The TOE Security Assurance Requirements (SAR) are based entirely on the assurance components defined in Part 3 of the Common Criteria (see part C or [1], Part 3 for details). The TOE meets the assurance requirements of the Evaluation Assurance Level EAL 4 augmented by ALC_FLR.3.

The TOE Security Functional Requirements (SFR) relevant for the TOE are outlined in the Security Target [6], chapter 6. They are selected from Common Criteria Part 2 and some of them are newly defined. Thus the TOE is CC Part 2 extended.

The TOE Security Functional Requirements are implemented by the following TOE Security Functionality:

TOE Security Functionality	Addressed issue
Identification and authentication	<p>DB2 relies on the identification and authentication performed by z/OS. When checking for the user's right to use authorities managed by DB2, the database management system uses the ID of the user verified by z/OS.</p> <p>Additionally, DB2 can establish a trusted connection with a user or system when a trusted context matches the characteristics of the connection, based on the user ID and connection trust attributes (e.g. IP address, domain name or SERVAUTH security zone name for a remote client, the job or task name for a local client). A trusted context allows the association of the trusted connection with a database role, a different user or a security label (in Labeled Security mode) for access control.</p>
Object access control	<p>In the evaluated configuration, DB2 uses RACF to check for and manage discretionary access control to DB2 objects. DB2 internal access controls based on the GRANT and REVOKE SQL statements will not be effective in the evaluated configuration.</p> <p>In the case of a trusted connection, access control also includes object ownership rules based on database roles. A database role can be</p>

TOE Security Functionality	Addressed issue
	<p>assigned to the DB2 process by a trusted context.</p> <p>DB2 also enforces access control at table row and column levels.</p> <p>In Labeled Security mode, mandatory access control is in effect: DB2 then uses the labels defined in the RACF profiles related to DB2 objects as well as the DB2-managed labels of rows in tables. In any case, the label-based access checks for mandatory access control are performed using RACF. In the case of a trusted connection, the default security label defined for the related trusted context, if any, is assigned to the DB2 process.</p>
Audit	The audit requirements are implemented using a mix of SMF records generated by RACF and the DB2 internal trace.
TSF management	In the evaluated configuration DB2 uses the functions provided by RACF to manage user profiles as well as the profiles related to DB2 objects. Access to authorities of DB2 objects is controlled by those profiles. Labels for rows in tables are assigned when they are created using the current label of the user that creates the row. The current label of the user is maintained by RACF.
TOE self protection	DB2 uses the protection mechanisms of z/OS with RACF to protect its address space, functions and objects from unauthorized access and manipulation.

Table 1: TOE Security Functionalities

For more details please refer to the Security Target [6], chapter 7.

The assets to be protected by the TOE are defined in the Security Target [6], chapter 3.1. Based on these assets the TOE Security Problem is defined in terms of Assumptions, Threats and Organisational Security Policies. This is outlined in the Security Target [6], chapter 3.2, 3.3 and 3.4.

This certification covers the configurations of the TOE as outlined in chapter 8.

The vulnerability assessment results as stated within this certificate do not include a rating for those cryptographic algorithms and their implementation suitable for encryption and decryption (see BSIG Section 9, Para. 4, Clause 2).

The certification results only apply to the version of the product indicated in the certificate and on the condition that all the stipulations are kept as detailed in this Certification Report. This certificate is not an endorsement of the IT product by the Federal Office for Information Security (BSI) or any other organisation that recognises or gives effect to this certificate, and no warranty of the IT product by BSI or any other organisation that recognises or gives effect to this certificate, is either expressed or implied.

2 Identification of the TOE

The Target of Evaluation (TOE) is called:

IBM DB2 Version 11 for z/OS Version 1 Release 13

The following table outlines the TOE deliverables:

No	Type	Identifier	Release	Form of Delivery
DB2, z/OS				
1	Software	platform portion of combined TOE, the Scope-of-supply of which is outlined in its own certification report under	IBM z/OS Version 1	see BSI-DSZ-CC-0788

No	Type	Identifier	Release	Form of Delivery
		certification ID BSI-DSZ-CC-0788 z/OS V1R13	Release 13	
2	Software	One of the following licensing options: <ul style="list-style-type: none"> • DB2 Version 11 for z/OS (standard version) - product number 5615-DB2 • DB2 Version 11 for z/OS (Value Unit Edition "VUE") - product number 5697-P43 	11	physical shipment
3	Software	DB2 Utilities Suite for z/OS - product number 5655-W87	11	physical shipment
4	Software Updates (PTFs)	<ul style="list-style-type: none"> • UI12584 (APAR PM97111) • UA67637 (APAR OA39506) • UA67929 (APAR OA39487) • UA67930 (APAR OA39486) 	-	electronic download (via ShopzSeries)
5	docs	<ul style="list-style-type: none"> • ServerPac: Installing Your Order • Requirements for the Common Criteria (SC19-4011-00) • Memo to Customers of DB2 11 for z/OS Common Criteria Evaluated Base • Requirements for the Common Criteria for z/OS (SC19-4058-EB) • DB2 for z/OS Introduction to DB2 for z/OS (SC19-4058-EB) • DB2 11 for z/OS Managing Security (SC19-4061-EB) • DB2 11 RACF Module Access Guide (SC19-4065-EB) • DB2 for z/OS Utility Guide and Reference (SC19-4067-EB) • DB2 Version 11 for z/OS Administration Guide (SC19-4050-00) • DB2 Version 11 for z/OS Application Programming and SQL Guide (SC19-4051-00) • DB2 Version 11 for z/OS Command Reference (SC19-4054-00) • DB2 Version 11 for z/OS Diagnosis Guide and Reference (LY37-3222-00) • DB2 Version 11 for z/OS Data Sharing: Planning and Administration (SC19-4055-00) • DB2 Version 11 for z/OS Messages (GC19-4062-01) • DB2 Version 11 for z/OS Managing Performance (SC19-4060-00) • DB2 Version 11 for z/OS SQL Reference (SC19-4066-00) • DB2 Version 11 for z/OS What's New? (GC19-4068-00) 	11	physical shipment (hardcopies and DVD)

No	Type	Identifier	Release	Form of Delivery
		<ul style="list-style-type: none"> • DB2 11 for z/OS (5615-DB2) standard licensing option: <ul style="list-style-type: none"> ◦ DB2 for z/OS Codes (GC19-4053-01) ◦ DB2 for z/OS Installation Guide (GC19-4056-00) ◦ DB2 11 VUE Softcopy Publications DVD (GI10-8951-003) ◦ DB2 for z/OS Licensed Program Specifications (GC19-4059-00) ◦ DB2 11 for z/OS License Information (GC19-4149-00) ◦ DB2 for z/OS Program Directory (GI10-8945-00) • DB2 11 for z/OS (5697-P43) Value Unit Edition (VUE) licensing option: <ul style="list-style-type: none"> ◦ DB2 for z/OS Installation Guide (GC19-4056-00) ◦ DB2 11 for z/OS License Information (GC19-4149-00) ◦ DB2 11 for z/OS Value Unit Edition Program Directory (GI10-8951-00) • DB2 Utilities Suite for z/OS V11.1 (5655-W87) • DB2 Utilities Suite for z/OS Agreements and License Information (GC19-4155-00) 		

Table 2: Deliverables of the TOE

The DB2 portion of the TOE is delivered as a ServerPac (a preconfigured set of software modules) on a cartridge that is physically shipped to the customer and installed by the customer via CustomPac install dialogs, as well as applicable PTFs that are available for electronic download. These additional PTFs which are part of DB2 or z/OS must be electronically downloaded using ShopzSeries IBM website.

The delivery of the TOE is a chain of processes to produce and ship the TOE components called ServerPacs, a preconfigured set of software modules that can be installed by the customer. The process starts when the TOE has been built by the developers and delivered to the production facility in Boulder, CO, where they are collected, packaged, and finally delivered to the customer.

3 Security Policy

The Security Policy is expressed by the set of Security Functional Requirements and implemented by the TOE. It covers the following issues:

- Identification and authentication
- Object access control
- Audit
- TSF management

- TOE self protection

4 Assumptions and Clarification of Scope

The Assumptions defined in the Security Target and some aspects of Threats and Organisational Security Policies are not covered by the TOE itself. These aspects lead to specific security objectives to be fulfilled by the TOE-Environment. The following topics are of relevance:

- Those responsible for the TOE are competent and trustworthy individuals, capable of managing the TOE and the security of the information it contains.
- If the TOE relies on remote trusted IT systems to support the enforcement of its policy, those systems provide the functions required by the TOE and are sufficiently protected from any attack that may cause those functions to provide false results.
- Those responsible for the TOE must establish and implement procedures to ensure that information is protected in an appropriate manner. In particular:
 - All network and peripheral cabling must be approved for the transmittal of the most sensitive data held by the system. Such physical links are assumed to be adequately protected against threats to the confidentiality and integrity of the data transmitted.
 - DAC protections on security-relevant files (such as audit trails and authentication databases) shall always be set up correctly.

Users are authorized to access parts of the data managed by the TOE and are trained to exercise control over their own data.

- Those responsible for the TOE must establish and implement procedures to ensure that the hardware, software and firmware components that comprise the system are distributed, installed and configured in a secure manner supporting the security mechanisms provided by the TOE.
- Authorized users of the TOE must ensure that the comprehensive diagnostics facilities provided by the product are invoked at every scheduled preventative maintenance period.
- Those responsible for the TOE must ensure that those parts of the TOE critical to enforcement of the security policy are protected from physical attack that might compromise IT security objectives. The protection must be commensurate with the value of the IT assets protected by the TOE.
- Those responsible for the TOE must ensure that procedures and/or mechanisms are provided to assure that after system failure or other discontinuity, recovery without a protection (security) compromise is achieved.
- The remote trusted IT systems implement the protocols and mechanisms required by the TSF to support the enforcement of the security policy. These remote trusted IT systems are under the same management domain as the TOE, are managed based on the same rules and policies applicable to the TOE, and are physically and logically protected equivalent to the TOE.

Details can be found in the Security Target [6], chapter 4.2.

5 Architectural Information

DB2 11 is a relational database management system that operates as a subsystem of z/OS. DB2 is implemented by a set of address spaces plus a set of utilities.

Users can access DB2 locally using "attachment facilities" or remotely via the Distributed Data Facility which uses the DRDA protocols defined in the Open Group Technical Standards DRDA-V1, DRDA-V2, and DRDA-V3.

Attachment facilities execute in the caller's address space and communicate with the DB2 address spaces to serve requests from the user. Attachment facilities included in the evaluated configuration include the TSO attachment facility via the DSN TSO command or the DB2I ISPF panels (which in turn use the DSN command to communicate with DB2).

Another attachment facility is the Call Attachment Facility (CAF), which allows programs executing under TSO or in the z/OS batch environment to communicate with DB2.

The Resource Recovery Services Attachment Facility (RRSAF) is a newer implementation of CAF with additional capabilities. RRS is a feature of z/OS that coordinates commit processing of recoverable resources in a z/OS system. DB2 supports use of these services for DB2 applications that use the RRS attachment facility provided with DB2. Use the RRS attachment to access resources such as SQL tables, DL/I databases, MQSeries messages, and recoverable VSAM files within a single transaction scope.

A requester using DRDA connects to an application server or database server. DRDA uses Distributed Data Management (DDM) and Formatted Data Object Content Architecture (FD:OCA) as part of the underlying architecture of DRDA. DDM is the communication language used for message interchange systems. FD:OCA is used to exchange user data among like or unlike systems. This allows external users to connect to DB2 and operate on DB2 databases.

The DB2 Utilities are a set of online and standalone programs providing database diagnostic and maintenance functions for administrators. The utilities do not use the standard attachment facilities and operate with the database files directly at the tablespace level.

The following figure shows the basic structure of DB2 and the attachment facilities supported in the evaluated configuration.

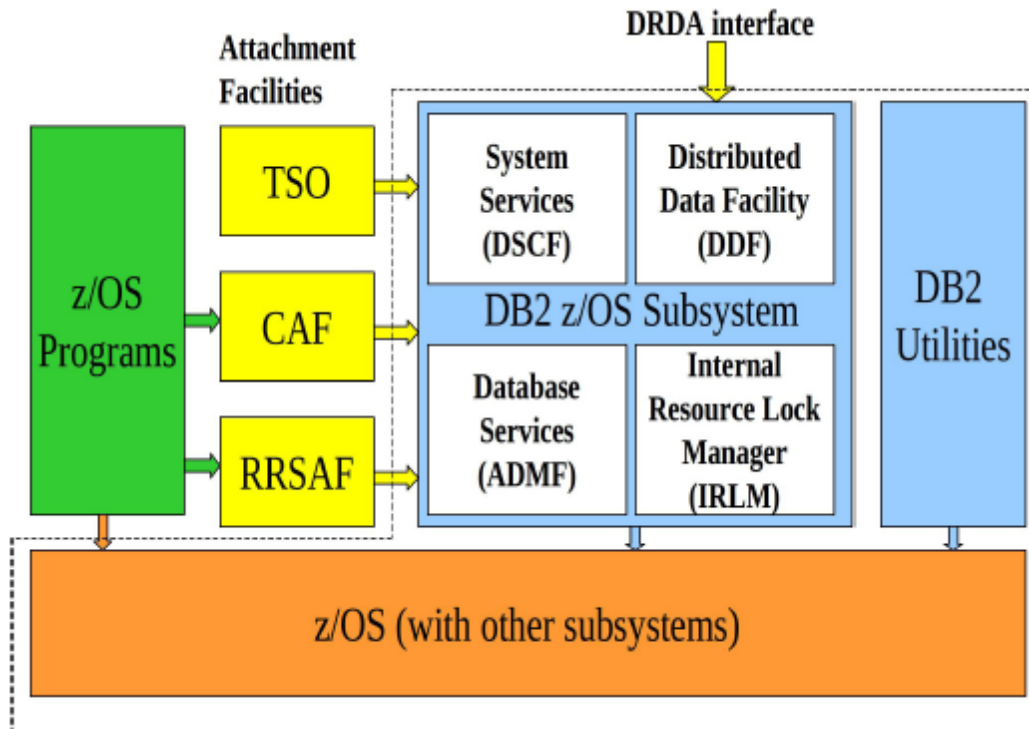

Figure 1: Basic structure of DB2 for z/OS showing TOE structure with TOE boundary

The blue boxes in this figure represent the trusted parts of DB2, the yellow boxes represent those parts of the attachment facilities of DB2 executing in the user's address space or connections using the network interface. The brown box represents the z/OS system that has already been evaluated as the platform of this combined TOE. The green box represents (untrusted) user programs using services of z/OS and DB2.

The yellow arrows in the figure represent external interfaces of the trusted parts of DB2. The brown arrow represents the external interfaces of the trusted parts of z/OS (which have been assessed in the z/OS evaluation). The blue arrows represent the interface between the trusted part of DB2 and the trusted part of z/OS.

It should be noted that this figure shows the main parts of the TOE and its interfaces, not a flow of information. It should also be noted that the interfaces are not disjointed. The trusted parts of DB2, for example, will also use interfaces to the trusted parts of z/OS that are also used by other programs operating on top of z/OS.

6 Documentation

The evaluated documentation as outlined in table 2 is being provided with the product to the customer. This documentation contains the required information for secure usage of the TOE in accordance with the Security Target.

Additional obligations and notes for secure usage of the TOE as outlined in chapter 10 of this report have to be followed.

7 IT Product Testing

7.1 Developer Testing

Testing Effort

The developer used a fully-automated test suite comprised of 150 test cases that split up into test case files where each test case file may test several functions and interface parameters. This test framework was used to test every ST claim, all interface functions, and subsystems, in both DAC and MAC context. Separate mapping files (for interfaces/subsystems and claims) were maintained. In addition, the developer used a summary sheet where the date of the successful execution of each test case was recorded. The test environment was comprised of several virtualized systems of DB2 on z/OS to test remote functionality. Most of the tests naturally focused on testing access privileges, which comprises the biggest portion of the TSF. In general, the testing effort allowed for very focused and fine-grained testing.

The test case description is embedded within the test files and refers explicitly to the test claims. The test environment was enhanced by scripts that check that the different test servers are still active during testing. Additional test scripts reverse the order of test cases to demonstrate that no interdependencies exist.

Approach

The developer's approach was to demonstrate that all ST claims, interfaces, and subsystems are verified by the tests.

Configuration

The provided test system is a virtualized environment on z/VM. Several VMs allow for distributed testing. The test tool TCPUN is installed on these machines to drive the test suites. The test systems are statically configured with necessary RACF options from z/OS and the DB2 Common Criteria specific settings. This includes defining users in RACF. As part of the test scripts, options are set dynamically to allow for DAC and MAC contexts, and user privileges and authorities are set dynamically as needed by each test case. The test environment was made available remotely. Test files were stored on the z/VM system and could be executed by the evaluator, either individually or as a group.

Depth

The tested behavior was covered down to the level of subsystems, and the evaluator could verify that most relevant execution paths were taken into account. Most test cases directly referred to the sections in the guidance and some cited paragraphs to smooth test development and verification in respect to specific TOE behavior. Each tested behavior was tested with different privileges if applicable, e.g., administrative users, users with explicit privileges for the task, or users without privileges (to test the negative case).

Results

The results of the developer showed a 100% successful test run.

7.2 Evaluator Testing Effort

Effort

The evaluator executed 3 of the 6 developer test suites where one of the test suites comprised the majority of all developer tests. The evaluator further devised 4 tests that are partially based on existing developer tests.

Approach

The evaluator used the test tool TCPUN to execute the test cases and to determine whether any of the tests failed. The test tool produced a results file for each unsuccessful test case, and summary files on the results for several tests. The evaluator also used

options of the tool to generate output files for test cases - even the ones that were successful. This was used to verify the comparison logic of the tool that takes place when comparing the actual results with the provided verification file.

All independent tests were executed on the test environment provided by the developer. The independent tests were devised to cover cases where the developer did not test all administrative authorities, or to test additional combinations of permission settings for new functions.

Configuration

The evaluator executed the developer test suites in both the Labeled Security and Controlled Access mode. The evaluator tests were performed in Controlled Access mode (no additional Labeled Security related tests were necessary).

The configuration was according to the evaluated configuration with one exception: at the end of the evaluation, a PTF was applied to the TOE. While the developer rerun all their tests, the evaluator examined the impact of the PTF and determined that the patch does not apply to the evaluated configuration as it only applies when RACF is not used for I&A. As a result, he decided to not rerun the independent tests.

Depth

Execution of the developer tests covered most interfaces and subsystems. The additional evaluator tests increase the coverage for testing different combinations of administrative authorities and privileges for new functions (increasing the rigor of the already thorough testing of access control functions).

Results

All tests were run successfully.

7.3 Evaluator Penetration Testing

Penetration testing effort

The evaluator considered common sources for vulnerabilities of DB2 in general and narrowed the findings down to what is applicable to the z/OS version of the product. The evaluator devised tests related to the following aspects:

- Potential SQL ID manipulation (SQL interface)
- Table manipulation through side-effects of other commands (SQL interface)
- Improper passphrase authentication (DRDA interface)
- DRDA server overflow vulnerability through chaining (DRDA interface)
- DRDA server general vulnerabilities through missing input validation (DRDA interface)
- DRDA session hijacking on data queries (DRDA interface)
- DRDA protocol violations (incorrect order, missing message (DRDA interface)

The DRDA tests were performed by using custom C test code. The test code is based on the `opendrda` project already used in the previous evaluation, but was enhanced to increase the test scope for the DRDA protocol. The evaluator was supported by the developer who, if needed, was observing the TOE error and trace logs for some of the tests, as well as providing some of the test setup (e.g. creating a user configured with a

passphrase), and examples of DRDA-communications with the help of a DB2 client program.

Testing approach

The tests focused on using remote access to the TOE (using the DRDA interface), which enabled the evaluator to perform more in-depth tests on specific DRDA aspects. This focused approach was favored against an approach where a variety of functionality is not so deeply tested, because the developer already runs a very thorough suite of test cases on all aspects of the TSF, and because any remote vulnerabilities are usually much more critical to the TOE. The goal was to reveal any TOE behavior that violates the security policy in terms of Identification and Authentication and to determine whether the TOE operation remains stable which would otherwise indicate incorrect verification of the input that might require additional investigation.

In addition to the DRDA tests, the evaluator tested the proper enforcement of password-phrases (although using a DRDA test, it is not a test of DRDA itself but the function reached through it), as well certain aspects of the SQL interface for table and SQL ID manipulation.

Test configuration

The test configuration comprised of the TOE residing in the developer test lab which was also used for independent testing. The test configuration was in accordance to the evaluated configuration as necessary for the testing (password complexity required for the z/OS configuration and an active TLS connection was not needed). From the set of the different TOE setups provided by the developer, the test was run on a setup that supported the distributed data facility which provided the working remote DRDA interface.

Depth

The main goal was to perform in-depth tests on the DRDA protocol (exchanging individual protocol parameter values with invalid input, incorrect length parameters, and changing the order of protocol messages, invalid request/reply object, leaving out protocol messages, sending large chunks of data, for both the login flow and a data query flow). All tests used the external accessible interfaces of the TOE, and the affected subsystems were the Distributed Data Services Subsystem (applies to most of the DRDA tests), the Relational Data Subsystem, and the System Services Subsystem.

Results

The tests were executed successfully. None of the test results indicated any vulnerability of the TOE.

8 Evaluated Configuration

This certification covers the following configurations of the TOE:

The evaluated configuration is documented in DB2 Version 11 for z/OS Requirements for the Common Criteria ([DB2CCG]). It is based on one of the two shipping options: DB2 Version 11 for z/OS (standard version) - product number 5615-DB2 or DB2 Version 11 for z/OS (Value Unit Edition "VUE") - product number 5697-P43, the underlying IBM z/OS Version 1 Release 13 and further components as listed in table 2.

Note, the difference between the two shipping options relates to the product licensing, not to product functionality. The chosen licensing option will be visible as a string identifier in the record facility of z/OS, and in the ISPF panel during installation. Both TOE versions are

completely representative because there is no functional difference between them which means the VUE-option does not contain additional functions, nor does it replace or remove functions of the standard edition. Therefore, although the actual testing only happened for a non-VUE-installation, its results apply to the VUE shipping version as well.

The software is to be used on the following hardware platforms specified in the z/OS Security Target ([8], 1.4.3.2):

The TOE is running within a logical partition provided by a certified version of PR/SM, on the z/Architecture as implemented by the following hardware platforms:

- *IBM System z10 Business Class with CP Assist for Cryptographic Functions (CPACF) DES/TDES Enablement Feature 3863 active, optionally with CryptoExpress3 card.*
- *IBM System z10 Enterprise Class with CPACF DES/TDES Enablement Feature 3863 active, optionally with CryptoExpress3 card.*
- *IBM zEnterprise 114 with CPACF DES/TDES Enablement Feature 3863 active , optionally with CryptoExpress3 card, and with or without the zEnterprise BladeCenter Extension (zBX).*
- *IBM zEnterprise 196 with CPACF DES/TDES Enablement Feature 3863 active, optionally with CryptoExpress3 card, and with or without the zEnterprise BladeCenter Extension (zBX).*

In addition, the TOE may run on a virtual machine provided by a certified version of z/VM.

The Evaluated Configuration Guide specifies a number of constraints, such as configuration values for various configuration files, specific steps to be taken during installation and information to administrators on how to manage the TOE.

9 Results of the Evaluation

9.1 CC specific results

The Evaluation Technical Report (ETR) [9] was provided by the ITSEF according to the Common Criteria [1], the Methodology [2], the requirements of the Scheme [3] and all interpretations and guidelines of the Scheme (AIS) [4] as relevant for the TOE.

The Evaluation Methodology CEM [2] was used.

As a result of the evaluation the verdict PASS is confirmed for the following assurance components:

- All components of the EAL 4 package including the class ASE as defined in the CC (see also part C of this report)
- The component ALC_FLR.3 augmented for this TOE evaluation.

As the evaluation work performed for this certification procedure was carried out as a re-evaluation based on the certificate BSI-DSZ-CC-0622-2012, re-use of specific evaluation tasks was possible. The focus of this re-evaluation was on the new functions and the component ALC.

The evaluation has confirmed:

- PP Conformance: Operating System Protection Profile, Version 2.0, 01 June 2010, BSI-CC-PP-0067-2010, OSPP Extended Package – Extended Identification and Authentication, Version 2.0, 28 May 2010, OSPP Extended Package – Labeled Security, Version 2.0, 28 May 2010 [7]
- for the Functionality: PP conformant plus product specific extensions
Common Criteria Part 2 extended
- for the Assurance: Common Criteria Part 3 conformant
EAL 4 augmented by ALC_FLR.3

The results of the evaluation are only applicable to the TOE as defined in chapter 2 and the configuration as outlined in chapter 8 above.

9.2 Results of cryptographic assessment

The vulnerability assessment results as stated within this certificate do not include a rating for those cryptographic algorithms and their implementation suitable for encryption and decryption (see BSIG Section 9, Para. 4, Clause 2). This holds for:

- the TOE Security Functionality (“RACF Passtickets”, “Authentication via Client Digital Certificates”, “Authentication via Kerberos”, “Communication Security”, and “TOE self protection using digital signatures”, “IDID”) and
- for other usage of encryption and decryption within the TOE.

10 Obligations and Notes for the Usage of the TOE

The documents as outlined in table 2 contain necessary information about the usage of the TOE and all security hints therein have to be considered. In addition all aspects of Assumptions, Threats and OSPs as outlined in the Security Target not covered by the TOE itself need to be fulfilled by the operational environment of the TOE.

The customer or user of the product shall consider the results of the certification within his system risk management process. In order for the evolution of attack methods and techniques to be covered, he should define the period of time until a re-assessment of the TOE is required and thus requested from the sponsor of the certificate.

If available, certified updates of the TOE should be used. If non-certified updates or patches are available the user of the TOE should request the sponsor to provide a re-certification. In the meantime a risk management process of the system using the TOE should investigate and decide on the usage of not yet certified updates and patches or take additional measures in order to maintain system security.

The limited validity for the usage of cryptographic algorithms as outlined in chapter 9 has to be considered by the user and his system risk management process.

11 Security Target

For the purpose of publishing, the Security Target [6] of the Target of Evaluation (TOE) is provided within a separate document as Annex A of this report.

12 Definitions

12.1 Acronyms

AIS	Application Notes and Interpretations of the Scheme
BSI	Bundesamt für Sicherheit in der Informationstechnik / Federal Office for Information Security, Bonn, Germany
BSIG	BSI-Gesetz / Act on the Federal Office for Information Security
CCRA	Common Criteria Recognition Arrangement
CC	Common Criteria for IT Security Evaluation
CEM	Common Methodology for Information Technology Security Evaluation
EAL	Evaluation Assurance Level
ETR	Evaluation Technical Report
IT	Information Technology
ITSEF	Information Technology Security Evaluation Facility
PP	Protection Profile
SAR	Security Assurance Requirement
SFP	Security Function Policy
SFR	Security Functional Requirement
ST	Security Target
TOE	Target of Evaluation
TSF	TOE Security Functionality

12.2 Glossary

Augmentation - The addition of one or more requirement(s) to a package.

Extension - The addition to an ST or PP of functional requirements not contained in part 2 and/or assurance requirements not contained in part 3 of the CC.

Formal - Expressed in a restricted syntax language with defined semantics based on well-established mathematical concepts.

Informal - Expressed in natural language.

Object - A passive entity in the TOE, that contains or receives information, and upon which subjects perform operations.

Protection Profile - An implementation-independent statement of security needs for a TOE type.

Security Target - An implementation-dependent statement of security needs for a specific identified TOE.

Semiformal - Expressed in a restricted syntax language with defined semantics.

Subject - An active entity in the TOE that performs operations on objects.

Target of Evaluation - A set of software, firmware and/or hardware possibly accompanied by guidance.

TOE Security Functionality - Combined functionality of all hardware, software, and firmware of a TOE that must be relied upon for the correct enforcement of the SFRs.

C Excerpts from the Criteria

CC Part 1:

Conformance Claim (chapter 10.4)

“The conformance claim indicates the source of the collection of requirements that is met by a PP or ST that passes its evaluation. This conformance claim contains a CC conformance claim that:

- describes the version of the CC to which the PP or ST claims conformance.
- describes the conformance to CC Part 2 (security functional requirements) as either:
 - **CC Part 2 conformant** - A PP or ST is CC Part 2 conformant if all SFRs in that PP or ST are based only upon functional components in CC Part 2, or
 - **CC Part 2 extended** - A PP or ST is CC Part 2 extended if at least one SFR in that PP or ST is not based upon functional components in CC Part 2.
- describes the conformance to CC Part 3 (security assurance requirements) as either:
 - **CC Part 3 conformant** - A PP or ST is CC Part 3 conformant if all SARs in that PP or ST are based only upon assurance components in CC Part 3, or
 - **CC Part 3 extended** - A PP or ST is CC Part 3 extended if at least one SAR in that PP or ST is not based upon assurance components in CC Part 3.

Additionally, the conformance claim may include a statement made with respect to packages, in which case it consists of one of the following:

- Package name Conformant - A PP or ST is conformant to a pre-defined package (e.g. EAL) if:
 - the SFRs of that PP or ST are identical to the SFRs in the package, or
 - the SARs of that PP or ST are identical to the SARs in the package.
- Package name Augmented - A PP or ST is an augmentation of a predefined package if:
 - the SFRs of that PP or ST contain all SFRs in the package, but have at least one additional SFR or one SFR that is hierarchically higher than an SFR in the package.
 - the SARs of that PP or ST contain all SARs in the package, but have at least one additional SAR or one SAR that is hierarchically higher than an SAR in the package.

Note that when a TOE is successfully evaluated to a given ST, any conformance claims of the ST also hold for the TOE. A TOE can therefore also be e.g. CC Part 2 conformant.

Finally, the conformance claim may also include two statements with respect to Protection Profiles:

- PP Conformant - A PP or TOE meets specific PP(s), which are listed as part of the conformance result.
- Conformance Statement (Only for PPs) - This statement describes the manner in which PPs or STs must conform to this PP: strict or demonstrable. For more information on this Conformance Statement, see Annex D.”

CC Part 3:

Class APE: Protection Profile evaluation (chapter 10)

“Evaluating a PP is required to demonstrate that the PP is sound and internally consistent, and, if the PP is based on one or more other PPs or on packages, that the PP is a correct instantiation of these PPs and packages. These properties are necessary for the PP to be suitable for use as the basis for writing an ST or another PP.

Assurance Class	Assurance Components
Class APE: Protection Profile evaluation	APE_INT.1 PP introduction
	APE_CCL.1 Conformance claims
	APE_SPD.1 Security problem definition
	APE_OBJ.1 Security objectives for the operational environment APE_OBJ.2 Security objectives
	APE_ECD.1 Extended components definition
	APE_REQ.1 Stated security requirements APE_REQ.2 Derived security requirements

APE: Protection Profile evaluation class decomposition”

Class ASE: Security Target evaluation (chapter 11)

“Evaluating an ST is required to demonstrate that the ST is sound and internally consistent, and, if the ST is based on one or more PPs or packages, that the ST is a correct instantiation of these PPs and packages. These properties are necessary for the ST to be suitable for use as the basis for a TOE evaluation.”

Security assurance components (chapter 7)

“The following Sections describe the constructs used in representing the assurance classes, families, and components.”

“Each assurance class contains at least one assurance family.”

“Each assurance family contains one or more assurance components.”

The following table shows the assurance class decomposition.

Assurance Class	Assurance Components
ADV: Development	ADV_ARC.1 Security architecture description
	ADV_FSP.1 Basic functional specification ADV_FSP.2 Security-enforcing functional specification ADV_FSP.3 Functional specification with complete summary ADV_FSP.4 Complete functional specification ADV_FSP.5 Complete semi-formal functional specification with additional error information ADV_FSP.6 Complete semi-formal functional specification with additional formal specification
	ADV_IMP.1 Implementation representation of the TSF ADV_IMP.2 Implementation of the TSF
	ADV_INT.1 Well-structured subset of TSF internals ADV_INT.2 Well-structured internals ADV_INT.3 Minimally complex internals
	ADV_SPM.1 Formal TOE security policy model
	ADV_TDS.1 Basic design ADV_TDS.2 Architectural design ADV_TDS.3 Basic modular design ADV_TDS.4 Semiformal modular design ADV_TDS.5 Complete semiformal modular design ADV_TDS.6 Complete semiformal modular design with formal high-level design presentation

Assurance class decomposition

Evaluation assurance levels (chapter 8)

“The Evaluation Assurance Levels (EALs) provide an increasing scale that balances the level of assurance obtained with the cost and feasibility of acquiring that degree of assurance. The CC approach identifies the separate concepts of assurance in a TOE at the end of the evaluation, and of maintenance of that assurance during the operational use of the TOE.

It is important to note that not all families and components from CC Part 3 are included in the EALs. This is not to say that these do not provide meaningful and desirable assurances. Instead, it is expected that these families and components will be considered for augmentation of an EAL in those PPs and STs for which they provide utility.”

Evaluation assurance level (EAL) overview (chapter 8.1)

“Table 1 represents a summary of the EALs. The columns represent a hierarchically ordered set of EALs, while the rows represent assurance families. Each number in the resulting matrix identifies a specific assurance component where applicable.

As outlined in the next Section, seven hierarchically ordered evaluation assurance levels are defined in the CC for the rating of a TOE's assurance. They are hierarchically ordered inasmuch as each EAL represents more assurance than all lower EALs. The increase in assurance from EAL to EAL is accomplished by substitution of a hierarchically higher assurance component from the same assurance family (i.e. increasing rigour, scope, and/or depth) and from the addition of assurance components from other assurance families (i.e. adding new requirements).

These EALs consist of an appropriate combination of assurance components as described in Chapter 7 of this CC Part 3. More precisely, each EAL includes no more than one component of each assurance family and all assurance dependencies of every component are addressed.

While the EALs are defined in the CC, it is possible to represent other combinations of assurance. Specifically, the notion of “augmentation” allows the addition of assurance components (from assurance families not already included in the EAL) or the substitution of assurance components (with another hierarchically higher assurance component in the same assurance family) to an EAL. Of the assurance constructs defined in the CC, only EALs may be augmented. The notion of an “EAL minus a constituent assurance component” is not recognised by the standard as a valid claim. Augmentation carries with it the obligation on the part of the claimant to justify the utility and added value of the added assurance component to the EAL. An EAL may also be augmented with extended assurance requirements.

Assurance Class	Assurance Family	Assurance Components by Evaluation Assurance Level						
		EAL1	EAL2	EAL3	EAL4	EAL5	EAL6	EAL7

Table 1: Evaluation assurance level summary”

Evaluation assurance level 1 (EAL1) - functionally tested (chapter 8.3)

“Objectives

EAL1 is applicable where some confidence in correct operation is required, but the threats to security are not viewed as serious. It will be of value where independent assurance is required to support the contention that due care has been exercised with respect to the protection of personal or similar information.

EAL1 requires only a limited security target. It is sufficient to simply state the SFRs that the TOE must meet, rather than deriving them from threats, OSPs and assumptions through security objectives.

EAL1 provides an evaluation of the TOE as made available to the customer, including independent testing against a specification, and an examination of the guidance documentation provided. It is intended that an EAL1 evaluation could be successfully conducted without assistance from the developer of the TOE, and for minimal outlay.

An evaluation at this level should provide evidence that the TOE functions in a manner consistent with its documentation.”

Evaluation assurance level 2 (EAL2) - structurally tested (chapter 8.4)

“Objectives

EAL2 requires the co-operation of the developer in terms of the delivery of design information and test results, but should not demand more effort on the part of the developer than is consistent with good commercial practise. As such it should not require a substantially increased investment of cost or time.

EAL2 is therefore applicable in those circumstances where developers or users require a low to moderate level of independently assured security in the absence of ready availability of the complete development record. Such a situation may arise when securing legacy systems, or where access to the developer may be limited.”

Evaluation assurance level 3 (EAL3) - methodically tested and checked (chapter 8.5)

“Objectives

EAL3 permits a conscientious developer to gain maximum assurance from positive security engineering at the design stage without substantial alteration of existing sound development practises.

EAL3 is applicable in those circumstances where developers or users require a moderate level of independently assured security, and require a thorough investigation of the TOE and its development without substantial re-engineering.”

Evaluation assurance level 4 (EAL4) - methodically designed, tested, and reviewed
(chapter 8.6)**“Objectives**

EAL4 permits a developer to gain maximum assurance from positive security engineering based on good commercial development practises which, though rigorous, do not require substantial specialist knowledge, skills, and other resources. EAL4 is the highest level at which it is likely to be economically feasible to retrofit to an existing product line.

EAL4 is therefore applicable in those circumstances where developers or users require a moderate to high level of independently assured security in conventional commodity TOEs and are prepared to incur additional security-specific engineering costs.”

Evaluation assurance level 5 (EAL5) - semiformally designed and tested (chapter 8.7)**“Objectives**

EAL5 permits a developer to gain maximum assurance from security engineering based upon rigorous commercial development practises supported by moderate application of specialist security engineering techniques. Such a TOE will probably be designed and developed with the intent of achieving EAL5 assurance. It is likely that the additional costs attributable to the EAL5 requirements, relative to rigorous development without the application of specialised techniques, will not be large.

EAL5 is therefore applicable in those circumstances where developers or users require a high level of independently assured security in a planned development and require a rigorous development approach without incurring unreasonable costs attributable to specialist security engineering techniques.”

Evaluation assurance level 6 (EAL6) - semiformally verified design and tested
(chapter 8.8)**“Objectives**

EAL6 permits developers to gain high assurance from application of security engineering techniques to a rigorous development environment in order to produce a premium TOE for protecting high value assets against significant risks.

EAL6 is therefore applicable to the development of security TOEs for application in high risk situations where the value of the protected assets justifies the additional costs.”

Evaluation assurance level 7 (EAL7) - formally verified design and tested
(chapter 8.9)

“Objectives

EAL7 is applicable to the development of security TOEs for application in extremely high risk situations and/or where the high value of the assets justifies the higher costs. Practical application of EAL7 is currently limited to TOEs with tightly focused security functionality that is amenable to extensive formal analysis.”

Class AVA: Vulnerability assessment (chapter 16)

“The AVA: Vulnerability assessment class addresses the possibility of exploitable vulnerabilities introduced in the development or the operation of the TOE.”

Vulnerability analysis (AVA_VAN) (chapter 16.1)

“Objectives

Vulnerability analysis is an assessment to determine whether potential vulnerabilities identified, during the evaluation of the development and anticipated operation of the TOE or by other methods (e.g. by flaw hypotheses or quantitative or statistical analysis of the security behaviour of the underlying security mechanisms), could allow attackers to violate the SFRs.

Vulnerability analysis deals with the threats that an attacker will be able to discover flaws that will allow unauthorised access to data and functionality, allow the ability to interfere with or alter the TSF, or interfere with the authorised capabilities of other users.”
