PP Conformance: Security IC Platform Protection Profile, Version 1.0, 15 June 2007, BSI-CC-PP-0035-2007
Functionality: PP conformant plus product specific extensions
Common Criteria Part 2 extended
Assurance: Common Criteria Part 3 conformant
EAL 5 augmented by ALC_DVS.2 and AVA_VAN.5

SOGIS
Recognition Agreement

The IT Product identified in this certificate has been evaluated at an approved evaluation facility using the Common Methodology for IT Security Evaluation (CEM), Version 3.1 extended by Scheme Interpretations by advice of the Certification Body for components beyond EAL 5 and CC Supporting Documents as listed in the Certification Report for conformance to the Common Criteria for IT Security Evaluation (CC), Version 3.1. CC and CEM are also published as ISO/IEC 15408 and ISO/IEC 18045.

(*) This certificate applies only to the specific version and release of the product in its evaluated configuration and in conjunction with the complete Certification Report and Notification. For details on the validity see Certification Report part A chapter 4

The evaluation has been conducted in accordance with the provisions of the certification scheme of the German Federal Office for Information Security (BSI) and the conclusions of the evaluation facility in the evaluation technical report are consistent with the evidence adduced.

This certificate is not an endorsement of the IT Product by the Federal Office for Information Security or any other organisation that recognises or gives effect to this certificate, and no warranty of the IT Product by the Federal Office for Information Security or any other organisation that recognises or gives effect to this certificate, is either expressed or implied.

This page is intentionally left blank.

Preliminary Remarks

Under the BSIG¹ Act, the Federal Office for Information Security (BSI) has the task of issuing certificates for information technology products.

Certification of a product is carried out on the instigation of the vendor or a distributor, hereinafter called the sponsor.

A part of the procedure is the technical examination (evaluation) of the product according to the security criteria published by the BSI or generally recognised security criteria.

The evaluation is normally carried out by an evaluation facility recognised by the BSI or by BSI itself.

The result of the certification procedure is the present Certification Report. This report contains among others the certificate (summarised assessment) and the detailed Certification Results.

The Certification Results contain the technical description of the security functionality of the certified product, the details of the evaluation (strength and weaknesses) and instructions for the user.

¹ Act on the Federal Office for Information Security (BSI-Gesetz - BSIG) of 14 August 2009, Bundesgesetzblatt I p. 2821

A. Certification

1. Specifications of the Certification Procedure

The certification body conducts the procedure according to the criteria laid down in the following:

- Act on the Federal Office for Information Security²
- BSI Certification and Approval Ordinance³
- BSI Schedule of Costs⁴
- Special decrees issued by the Bundesministerium des Innern (Federal Ministry of the Interior)
- DIN EN ISO/IEC 17065 standard
- BSI certification: Scheme documentation describing the certification process (CC-Produkte) [3]
- BSI certification: Scheme documentation on requirements for the Evaluation Facility, its approval and licencing process (CC-Stellen) [3]
- Common Criteria for IT Security Evaluation (CC), Version 3.1⁵ [1] also published as ISO/IEC 15408.
- Common Methodology for IT Security Evaluation (CEM), Version 3.1 [2] also published as ISO/IEC 18045.
- BSI certification: Application Notes and Interpretation of the Scheme (AIS) [4]

2. Recognition Agreements

In order to avoid multiple certification of the same product in different countries a mutual recognition of IT security certificates - as far as such certificates are based on ITSEC or CC - under certain conditions was agreed.

2.1. European Recognition of ITSEC/CC – Certificates (SOGIS-MRA)

The SOGIS-Mutual Recognition Agreement (SOGIS-MRA) Version 3 became effective in April 2010. It defines the recognition of certificates for IT-Products at a basic recognition level and, in addition, at higher recognition levels for IT-Products related to certain SOGIS Technical Domains only.

² Act on the Federal Office for Information Security (BSI-Gesetz - BSIG) of 14 August 2009, Bundesgesetzblatt I p. 2821

³ Ordinance on the Procedure for Issuance of Security Certificates and approval by the Federal Office for Information Security (BSI-Zertifizierungs- und -Anerkennungsverordnung - BSIZertV) of 17 December 2014, Bundesgesetzblatt 2014, part I, no. 61, p. 2231

⁴ Schedule of Cost for Official Procedures of the Bundesamt für Sicherheit in der Informationstechnik (BSI-Kostenverordnung, BSI-KostV) of 03 March 2005, Bundesgesetzblatt I p. 519

⁵ Proclamation of the Bundesministerium des Innern of 12 February 2007 in the Bundesanzeiger dated 23 February 2007, p. 3730

The basic recognition level includes Common Criteria (CC) Evaluation Assurance Levels EAL 1 to EAL 4 and ITSEC Evaluation Assurance Levels E1 to E3 (basic). For "Smartcards and similar devices" a SOGIS Technical Domain is in place. For "HW Devices with Security Boxes" a SOGIS Technical Domains is in place, too. In addition, certificates issued for Protection Profiles based on Common Criteria are part of the recognition agreement.

The new agreement has been signed by the national bodies of Austria, Finland, France, Germany, Italy, The Netherlands, Norway, Spain, Sweden and the United Kingdom. The current list of signatory nations and approved certification schemes, details on recognition, and the history of the agreement can be seen on the website at <https://www.sogisportal.eu>.

The SOGIS-MRA logo printed on the certificate indicates that it is recognised under the terms of this agreement by the nations listed above.

This certificate is recognized under SOGIS-MRA for all assurance components selected.

2.2. International Recognition of CC – Certificates (CCRA)

The international arrangement on the mutual recognition of certificates based on the CC (Common Criteria Recognition Arrangement, CCRA-2014) has been ratified on 08 September 2014. It covers CC certificates based on collaborative Protection Profiles (cPP) (exact use), CC certificates based on assurance components up to and including EAL 2 or the assurance family Flaw Remediation (ALC_FLR) and CC certificates for Protection Profiles and for collaborative Protection Profiles (cPP).

The CCRA-2014 replaces the old CCRA signed in May 2000 (CCRA-2000). Certificates based on CCRA-2000, issued before 08 September 2014 are still under recognition according to the rules of CCRA-2000. For on 08 September 2014 ongoing certification procedures and for Assurance Continuity (maintenance and re-certification) of old certificates a transition period on the recognition of certificates according to the rules of CCRA-2000 (i.e. assurance components up to and including EAL 4 or the assurance family Flaw Remediation (ALC_FLR)) is defined until 08 September 2017.

As of September 2014 the signatories of the new CCRA-2014 are government representatives from the following nations: Australia, Austria, Canada, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, India, Israel, Italy, Japan, Malaysia, The Netherlands, New Zealand, Norway, Pakistan, Republic of Korea, Singapore, Spain, Sweden, Turkey, United Kingdom, and the United States.

The current list of signatory nations and approved certification schemes can be seen on the website: <http://www.commoncriteriaportal.org>.

The Common Criteria Recognition Arrangement logo printed on the certificate indicates that this certification is recognised under the terms of this agreement by the nations listed above.

As this certificate is a re-certification of a certificate issued according to CCRA-2000 this certificate is recognized according to the rules of CCRA-2000, i.e. up to and including CC part 3 EAL 4 components. The evaluation contained the components ALC_DVS.2, AVA_VAN.5, ADV_FSP.5, ADV_INT.2, ADV_TDS.4, ALC_CMS.5, ALC_TAT.2 and ATE_DPT.3 that are not mutually recognised in accordance with the provisions of the CCRA-2000, for mutual recognition the EAL 4 components of these assurance families are relevant.

3. Performance of Evaluation and Certification

The certification body monitors each individual evaluation to ensure a uniform procedure, a uniform interpretation of the criteria and uniform ratings.

The product Infineon Technologies Smart Card IC (Security Controller) M5072 with optional RSA v1.03.006/v2.06.003, EC v1.03.006/ v2.06.003, Toolbox v1.03.006/ v2.06.003, SCL v2.02.010 libraries with specific IC dedicated software has undergone the certification procedure at BSI. This is a re-certification based on BSI-DSZ-CC-0946-V2-2015. Specific results from the evaluation process BSI-DSZ-CC-0946-V2-2015 were re-used.

The evaluation of the product Infineon Technologies Smart Card IC (Security Controller) M5072 with optional RSA v1.03.006/v2.06.003, EC v1.03.006/ v2.06.003, Toolbox v1.03.006/ v2.06.003, SCL v2.02.010 libraries with specific IC dedicated software was conducted by TÜV Informationstechnik GmbH. The evaluation was completed on 27 July 2017. TÜV Informationstechnik GmbH is an evaluation facility (ITSEF)⁶ recognised by the certification body of BSI.

For this certification procedure the sponsor and applicant is: Infineon Technologies AG.

The product was developed by: Infineon Technologies AG.

The certification is concluded with the comparability check and the production of this Certification Report. This work was completed by the BSI.

4. Validity of the Certification Result

This Certification Report only applies to the version of the product as indicated. The confirmed assurance package is only valid on the condition that

- all stipulations regarding generation, configuration and operation, as given in the following report, are observed,
- the product is operated in the environment described, as specified in the following report and in the Security Target.

For the meaning of the assurance levels please refer to the excerpts from the criteria at the end of the Certification Report or in the CC itself.

The Certificate issued confirms the assurance of the product claimed in the Security Target at the date of certification. As attack methods evolve over time, the resistance of the certified version of the product against new attack methods needs to be re-assessed. Therefore, the sponsor should apply for the certified product being monitored within the assurance continuity program of the BSI Certification Scheme (e.g. by a re-certification). Specifically, if results of the certification are used in subsequent evaluation and certification procedures, in a system integration process or if a user's risk management needs regularly updated results, it is recommended to perform a re-assessment on a regular e.g. annual basis.

In order to avoid an indefinite usage of the certificate when evolved attack methods require a re-assessment of the products resistance to state of the art attack methods, the maximum validity of the certificate has been limited. The certificate issued on 18 August 2017 is valid until 17 August 2022. Validity can be re-newed by re-certification.

⁶ Information Technology Security Evaluation Facility

The owner of the certificate is obliged:

1. when advertising the certificate or the fact of the product's certification, to refer to the Certification Report as well as to provide the Certification Report, the Security Target and user guidance documentation mentioned herein to any customer of the product for the application and usage of the certified product,
2. to inform the Certification Body at BSI immediately about vulnerabilities of the product that have been identified by the developer or any third party after issuance of the certificate,
3. to inform the Certification Body at BSI immediately in the case that security relevant changes in the evaluated life cycle, e.g. related to development and production sites or processes, occur, or the confidentiality of documentation and information related to the Target of Evaluation (TOE) or resulting from the evaluation and certification procedure where the certification of the product has assumed this confidentiality being maintained, is not given any longer. In particular, prior to the dissemination of confidential documentation and information related to the TOE or resulting from the evaluation and certification procedure that do not belong to the deliverables according to the Certification Report part B, or for those where no dissemination rules have been agreed on, to third parties, the Certification Body at BSI has to be informed.

In case of changes to the certified version of the product, the validity can be extended to the new versions and releases, provided the sponsor applies for assurance continuity (i.e. re-certification or maintenance) of the modified product, in accordance with the procedural requirements, and the evaluation does not reveal any security deficiencies.

5. Publication

The product Infineon Technologies Smart Card IC (Security Controller) M5072 with optional RSA v1.03.006/v2.06.003, EC v1.03.006/ v2.06.003, Toolbox v1.03.006/ v2.06.003, SCL v2.02.010 libraries with specific IC dedicated software has been included in the BSI list of certified products, which is published regularly (see also Internet: <https://www.bsi.bund.de> and [5]). Further information can be obtained from BSI-Infoline +49 228 9582-111.

Further copies of this Certification Report can be requested from the developer⁷ of the product. The Certification Report may also be obtained in electronic form at the internet address stated above.

B. Certification Results

The following results represent a summary of

- the Security Target of the sponsor for the Target of Evaluation,
- the relevant evaluation results from the evaluation facility, and
- complementary notes and stipulations of the certification body.

1. Executive Summary

This is a re-evaluation of the certification BSI-DSZ-CC-0946-V2-2015.

The Target of Evaluation (TOE) is Infineon Technologies Smart Card IC (Security Controller) M5072 with optional RSA v1.03.006/v2.06.003, EC v1.03.006/ v2.06.003, Toolbox v1.03.006/ v2.06.003, SCL v2.02.010 libraries with specific IC dedicated software. The TOE provides a real 32-bit CPU-architecture and is compatible to the ARMv7-M instruction set. The major components of the core system are the 32-bit CPU (Central Processing Unit), the Cache system, the MPU (Memory Protection Unit) and the MED (Memory Encryption/Decryption Unit).

The TOE consists of the hardware part, the firmware parts and the software parts. The software parts are differentiated into: the asymmetric cryptographic libraries RSA and EC and the symmetric cryptographic library SCL for DES and AES.

This TOE is intended to be used in smart cards for particularly security relevant applications and for its previous use as developing platform for smart card operating systems. The term Smartcard Embedded Software is used in the following for all operating systems and applications stored and executed on the TOE. The TOE is the platform for the Smartcard Embedded Software.

In comparison to the previous certification (BSI-DSZ-CC-0946-V2-2015), the TOE is identical with the exceptions of:

- a new version (v2.06.003) of the RSA, EC, Toolbox and Base library has been introduced,
- addition of the symmetric crypto library (SCL) v2.02.010,
- The RSA key generation (FCS_CKM.1/RSA) is now optional/conditional, in dependence of the RSA library version,
- new guidance documentation.

The Security Target [6] is the basis for this certification. It is based on the certified Protection Profile Security IC Platform Protection Profile, Version 1.0, 15 June 2007, BSI-CC-PP-0035-2007 [8].

The TOE Security Assurance Requirements (SAR) are based entirely on the assurance components defined in Part 3 of the Common Criteria (see part C or [1], Part 3 for details). The TOE meets the assurance requirements of the Evaluation Assurance Level EAL 5 augmented by ALC_DVS.2 and AVA_VAN.5.

The TOE Security Functional Requirements (SFR) relevant for the TOE are outlined in the Security Target [6] and [9], chapter 7. They are selected from Common Criteria Part 2 and some of them are newly defined. Thus the TOE is CC Part 2 extended.

The TOE Security Functional Requirements are implemented by the following TOE Security Functionality:

TOE Security Functionality	Addressed issue
SF_DPM	Device Phase Management: The life cycle of the TOE is split up into several phases. Different operation modes help to protect the TOE during each phase of its lifecycle.

TOE Security Functionality	Addressed issue
SF_PS	Protection against Snooping: The TOE uses various means to protect from snooping of vital TOE parts.
SF_PMA	Protection against Modifying Attacks: This TOE implements protection against modifying attacks of vital TOE parts.
SF_PLA	Protection against Logical Attacks.
SF_CS	Cryptographic Support: The TOE is equipped with several hardware accelerators and software modules to support the standard symmetric and asymmetric cryptographic operations. Additionally the TOE is equipped with a True Random Number Generator for the generation of random numbers.

Table 1: TOE Security Functionalities

For more details please refer to the Security Target [6] and [9], chapter 8.

The assets to be protected by the TOE are defined in the Security Target [6] and [9], chapter 4.1.2 . Based on these assets the TOE Security Problem is defined in terms of Assumptions, Threats and Organisational Security Policies. This is outlined in the Security Target [6] and [9], chapters 4.3, 4.1 and 4.2 (respectively).

Regarding the firmware the user has the possibility to choose between different firmware versions (80001141, 80001144 or 80001145). Depending on the blocking configuration the TOE can have different user available configuration by order or by BPU.

This certification covers the configurations of the TOE as outlined in chapter 8.

The vulnerability assessment results as stated within this certificate do not include a rating for those cryptographic algorithms and their implementation suitable for encryption and decryption (see BSIG Section 9, Para. 4, Clause 2).

The certification results only apply to the version of the product indicated in the certificate and on the condition that all the stipulations are kept as detailed in this Certification Report. This certificate is not an endorsement of the IT product by the Federal Office for Information Security (BSI) or any other organisation that recognises or gives effect to this certificate, and no warranty of the IT product by BSI or any other organisation that recognises or gives effect to this certificate, is either expressed or implied.

2. Identification of the TOE

The Target of Evaluation (TOE) is called:

Infineon Technologies Smart Card IC (Security Controller) M5072 with optional RSA v1.03.006/v2.06.003, EC v1.03.006/ v2.06.003, Toolbox v1.03.006/ v2.06.003, SCL v2.02.010 libraries with specific IC dedicated software

The following table outlines the TOE deliverables:

Type	Identifier	Release	Form of Delivery / Note
HW	M5072 Smart Card IC	G11 (produced in Tainan)	Bare dies, plain wafers, complete modules or IC cases.

Type	Identifier	Release	Form of Delivery / Note
SW	Flash Loader	FW Identifier 80 00 11 41 or 80 00 11 44 or 80 00 11 45	Stored in ROM on the IC (patch in NVM).
SW	BOS Boot System (the IC Dedicated Test Software)	FW Identifier 80 00 11 41 or 80 00 11 44 or 80 00 11 45	Stored in Test ROM on the IC.
SW	RMS Resource Management System (the IC Dedicated Support Software)	FW Identifier 80 00 11 41 or 80 00 11 44 or 80 00 11 45	Stored in ROM on the IC (patch in NVM)
SW	Mifare-compatible OS	FW Identifier 80 00 11 41 or 80 00 11 44 or 80 00 11 45	Stored in ROM on the IC Optional.
SW	NVM image (including Embedded Software)	--	Stored in Flash memory on the IC.
SW	RSA library	RSA2048 1.03.006 or 2.06.003 RSA4096 1.03.006 or 2.06.003	Optional.
SW	EC library	1.03.006 or 2.06.003	Optional.
SW	Toolbox	1.03.006 or 2.06.003	Optional.
SW	Base library	1.03.006 or 2.06.003	Optional.
SW	Symmetric Crypto Library	2.02.010	Optional.
SW	Management of Mifare-compatible Cards	01.03.0927 or 01.04.1275	Optional.
SW	Mifare-compatible Reader Mode Support	01.02.0800	Optional.

Table 2: Deliverables of the TOE

The delivery procedures follow the user demands, meaning that the user defines the procedures applied for delivery. These procedures include, but are not limited to, selection of the carrier, packing requirements, labelling, delivery documentation and information. The delivery to the user is always via the regional distribution centres, which are also audited.

Three different delivering procedures have to be taken into consideration:

- Delivery of the IC dedicated software components (IC dedicated SW, guidance) from the TOE Manufacturer to the IC Embedded Software Developer.
- Delivery of the IC Embedded Software (ROM / Flash data, initialisation and prepersonalization data, Bundle Business package) from the IC Embedded Software Developer to the TOE Manufacturer.
- Delivery of the final TOE from the TOE Manufacturer to the Composite Product Manufacturer. After phase 3 the TOE is delivered in form of wafers or sawn wafers, after phase 4 in form of modules.

The individual TOE hardware is uniquely identified by its identification data. Each individual TOE can be traced unambiguously and thus assigned to the entire development and production process.

Furthermore, the chip identification data is accessible via the Generic Chip Identification Mode (GCIM). The Generic Chip Identification Mode (GCIM) can be activated after power-on with a dedicated signalling sequence and is also accessible by the user software. This GCIM outputs a variety of unique identification information. Additionally the customer can identify the present configuration by reading the relevant data in special memory area (see [14], section 9.2.1). The firmware part of the TOE is also identified via the GCIM. The firmware identifier represents the firmware parts RMS, BOS, FL, Mifare and patch version (if existing). The RSA (optional), EC (optional), the Mifare-compatible Interface Libraries (Card Management and Reader Mode) (optional), Toolbox (optional), Base Library (optional), and SCL (optional), as separate software parts of the TOE, are as well identified by their unique version numbers. Additionally, the user can also identify these versions by a defined procedure. A mapping of these additional identification values to the version numbers is provided in [6] chapter 10.

As the TOE is under control of the user software, the TOE Manufacturer can only guarantee the integrity up to the delivery procedure. It is in the responsibility of the Composite Product Manufacturer to include mechanisms in the implemented software (developed by the IC Embedded Software Developer) which allow detection of modifications after the delivery.

The TOE can be delivered in various configurations, achieved by means of blocking and depending on the customer order. All product derivatives of this TOE, including all configuration possibilities differentiated by the GCIM (Generic Chip Identification Mode) data and the configuration information output, are manufactured by Infineon Technologies AG. New configurations can occur at any time depending on the user blocking or by different configurations applied by the manufacturer. In any case the user is able to clearly identify the TOE hardware, its configuration and proof the validity of the certificate independently, meaning without involving the manufacturer. The various blocking options, as well as the means used for the blocking, are done during the manufacturing process or at user premises. Entirely all means of blocking and the, for the blocking involved firmware respectively software parts, used at Infineon Technologies AG and/or the user premises, are subject of the evaluation. All resulting configurations of a TOE derivative are subject of the certificate. All resulting configurations are either at the predefined limits or within the predefined configuration ranges. For more information about blocking, please compare chapter 8.

3. Security Policy

The Security Policy is expressed by the set of Security Functional Requirements and implemented by the TOE. It covers the following issues: The Security Policy of the TOE is to provide basic security functionalities to be used by the smart card operating system and the smart card application, thus providing an overall smart card system security. Therefore, the TOE will implement a symmetric cryptographic block cipher algorithms (Triple-DES and AES), to ensure the confidentiality of plain text data by encryption and to support secure authentication protocols and it will provide a random number generation of appropriate quality.

The SCL uses the symmetric cryptographic co-processor (SCP) of the hardware to provide the user with a software interface to the DES and AES calculations and adds countermeasures to assorted functions, protecting against leakage and fault attacks.

The RSA library is used to provide a high level interface to RSA (Rivest, Shamir, Adleman) cryptography implemented on the hardware component Crypto@2304T and includes countermeasures against SPA, DPA and DFA attacks. The EC library is used to provide a high level interface to Elliptic Curve cryptography implemented on the hardware component Crypto@2304T and includes countermeasures against SPA, DPA and DFA attacks.

As the TOE is a hardware security platform, the security policy of the TOE is also to provide protection against leakage of information (e.g. to ensure the confidentiality of cryptographic keys during AES, Triple-DES, RSA and EC cryptographic functions performed by the TOE), against physical probing, against malfunctions, against physical manipulations and against abuse of functionality. Hence the TOE shall

- maintain the integrity and the confidentiality of data stored in the memory of the TOE and

- maintain the integrity, the correct operation and the confidentiality of security functionalities (security mechanisms and associated functions) provided by the TOE.

Specific details concerning the above mentioned security policies can be found in chapter 7 and 8 of the Security Target [6] and [9].

4. Assumptions and Clarification of Scope

The Assumptions defined in the Security Target and some aspects of Threats and Organisational Security Policies are not covered by the TOE itself. These aspects lead to specific security objectives to be fulfilled by the TOE-Environment. The following topics are of relevance:

The ST only includes two security objectives for the IC Embedded Software Developer, the objectives OE.Plat-Appl and OE.Resp-Appl.

- The objective OE.Plat-Appl states that the IC Embedded Software Developer shall design his software so that the requirements from the data sheet ([13], [15]), the TOE application notes ([12]), other guidance documents ([14], [18], [16], [19]) and findings of the TOE evaluation report are implemented. As all these documents are identified as parts of the TOE and delivered to the IC Embedded Software Developer, the objective OE.Plat-Appl is fulfilled.
- The objective OE.Resp-Appl states that the IC Embedded Software Developer shall treat user data (especially keys) appropriately. The IC Embedded Software Developer gets sufficient information on how to protect user data adequate in the security guidelines [12].

The ST only includes one security objective for the operational environment (for the Composite Product Manufacturer), the objective OE.Process-Sec-IC.

- OE.Process-Sec-IC states that security procedures are used after delivery of the TOE by the TOE Manufacturer up to delivery to the end-consumer to maintain confidentiality and integrity of the TOE and of its manufacturing and test data (to prevent any possible copy, modification, retention, theft or unauthorised use). This means that the phases after TOE delivery are assumed to be protected appropriately.

The Composite Product Manufacturer therefore has to be informed only about the general requirement resulting from OE.Process-Sec-IC. The Composite Product Manufacturer is informed about these requirements resulting from OE.Process-Sec-IC in [18].

5. Architectural Information

The TOE is an integrated circuit (IC) providing a platform to a smart card operating system and smart card application software. A top level block diagram and a list of subsystems can be found within the TOE description of the Security Target Lite [9], chapter 2.1.

The TOE implements a dedicated security 32-bit RISC CPU designed on the basis of the ARMv7_M architecture. The core system is then composed by the 32-bit CPU as a variant of the ARM® SecurCore™ SC300™, the Cache system, the Memory Protection Unit and the Memory Encryption/Decryption Unit. The TOE implements a full 32-bit addressing with up to 4 GByte linear addressable memory space, a simple scalable memory management concept and a scalable stack size. The TOE embeds its own ROM, RAM and Non Volatile Memory, protected by the Infineon's SOLID FLASH™ NVM1 memory system also called NVM in the following description.

Two co-processors for cryptographic operations are implemented on the TOE. The Crypto2304T for calculation of asymmetric algorithms like RSA and Elliptic Curve (EC) and the Symmetric Cryptographic Processor (SCP) for dual-key or triple-key triple-DES and AES calculations. These co-processors are especially designed for smart card applications with respect to the security and power consumption. The SCP module computes the complete DES algorithm within a few clock cycles and is especially designed to counter attacks like DPA, EMA and DFA. The Crypto2304T module provides basic functions for the implementation of RSA and EC cryptographic libraries.

The BOS (Boot Software) and the RMS (Resource Management System) compose the TOE firmware stored in the ROM and the patches hereof in the NVM. All mandatory functions for start-up and internal testing are protected by a dedicated hardware firewall. Additionally two levels are provided, the privileged level and the user level, both are protected by a hardwired Memory Protection Unit (MPU) setting.

The RMS is accessible in privileged level only. The FL (Flash Loader) and the Mifare-compatible software compose the TOE software stored in the NVM. The FL allows downloading of User Software into the NVM during the manufacturing process and can be completely deactivated.

The Symmetric cryptographic library (SCL), delivered as object code (optional), provides a high level interface to the DES/TDES and AES of the hardware component SCP.

As well as the RSA and EC libraries, delivered as object code (also optional), which provide a high level interface to EC implemented on the hardware component Crypto@2304T.

6. Documentation

The evaluated documentation as outlined in table 2 is being provided with the product to the customer. This documentation contains the required information for secure usage of the TOE in accordance with the Security Target.

Additional obligations and notes for secure usage of the TOE as outlined in chapter 10 of this report have to be followed.

7. IT Product Testing

The tests performed by the developer were divided into five categories:

- Simulation tests (design verification),
- Qualification tests,
- Verification Tests,
- Security Evaluation Tests,
- Production Tests.

The developer tests covered all security functionalities and all security mechanisms as identified in the functional specification.

The evaluators were able to repeat the tests of the developer either using the library of programs, tools and prepared chip samples delivered to the evaluator or at the developer's site. Independent tests were performed, in order to supplement, augment and to verify the tests performed by the developer. For the developer tests repeated by the evaluators,

other test parameters were used and the test equipment was varied. Security features of the TOE, realised by specific design and layout measures, were checked by the evaluators during layout inspections both in design data and on the final product.

The evaluation has shown that the actual version of the TOE provides the security functionalities as specified by the developer. The test results confirmed the correct implementation of the TOE security functionalities.

For penetration testing, the evaluators took all security functionalities into consideration. Intensive penetration testing was planned based on the analysis results and performed for the underlying mechanisms of security functionalities. The penetration tests considered both the physical tampering of the TOE and attacks which do not modify the TOE physically. The penetration tests results confirm that the TOE is resistant to attackers with high attack potential in the intended environment for the TOE.

8. Evaluated Configuration

This certification covers the following configurations of the TOE:

- Smartcard IC M5072 G11 (Tainan/Taiwan).

This TOE is represented by various configurations called products, which are all derived from the equal hardware design M5072. The same mask is used to produce different products of the TOE. The first metal mask (called the M1 mask) contains the specific information to identify the TOE.

The M5072 product offers different configuration options, which a customer can choose. The mechanism to choose a configuration can be done by the following methods:

- by product selection or dialog-based in Tools,
- via Bill-per-Use (BPU) and Flash Loader (FL).

The degree of freedom for configuring the TOE is predefined by Infineon Technologies AG. The list of predefined TOE configurations is given, as an example in the Security Target [6] and [9] in Table 4 and in the Hardware Reference Manual [13], section 18.

All these possible TOE configurations equal and/or within the specified ranges are covered by the certificate. Beside fix TOE configurations, which can be ordered as usual, this TOE implements optionally the so called Bill-Per-Use (BPU) ability. This solution enables the customer to tailor the product on his own to the required configuration by blocking parts of the chip on demand into the final configuration at his own premises, without further delivery or involving support by Infineon Technology AG. Customers, who are intended to use this feature receiving the TOE in a predefined configuration including the Flash Loader software, enhanced with the BPU blocking software. The blocking information is part of a chip configuration area and can be modified by customers using specific APDUs. Once a final blocking is done, further modifications are disabled. The BPU software part is only present on the products which have been ordered with the BPU option. In all other cases this software is not present on the product. For more details please refer to the Security Target [6] and [9], chapters 2.2.7 and 2.2.8.

Depending on the blocking configuration, a M5072 product can have different user available configurations listed in Table 4 of the Security Target [6] and [9].

9. Results of the Evaluation

9.1. CC specific results

The Evaluation Technical Report (ETR) [9] was provided by the ITSEF according to the Common Criteria [1], the Methodology [2], the requirements of the Scheme [3] and all interpretations and guidelines of the Scheme (AIS) [4] as relevant for the TOE.

The Evaluation Methodology CEM [2] was used for those components up to EAL 5 extended by advice of the Certification Body for components beyond EAL 5 and guidance specific for the technology of the product [4] (AIS 34).

The following guidance specific for the technology was used:

- The Application of CC to Integrated Circuits,
- The Application of Attack Potential to Smartcards,
- Guidance, Smartcard Evaluation,

(see [4], AIS 25, AIS 26, AIS 31).

For RNG assessment the scheme interpretations AIS 31 was used (see [4]).

To support composite evaluations according to AIS 36 the document ETR for composite evaluation [10] was provided and approved. This document provides details of this platform evaluation that have to be considered in the course of a composite evaluation on top.

The assurance refinements outlined in the Security Target were followed in the course of the evaluation of the TOE.

As a result of the evaluation the verdict PASS is confirmed for the following assurance components:

- All components of the EAL 5 package including the class ASE as defined in the CC (see also part C of this report),
- The components ALC_DVS.2 and AVA_VAN.5 augmented for this TOE evaluation.

As the evaluation work performed for this certification procedure was carried out as a re-evaluation based on the certificate BSI-DSZ-CC-0946-V2-2015, re-use of specific evaluation tasks was possible. The focus of this re-evaluation was on inclusion of the asymmetric and symmetric crypto libs, as well as respective guidance documentation changes.

The evaluation has confirmed:

- PP Conformance: Security IC Platform Protection Profile, Version 1.0, 15 June 2007, BSI-CC-PP-0035-2007 [8]
- for the Functionality: PP conformant plus product specific extensions
Common Criteria Part 2 extended
- for the Assurance: Common Criteria Part 3 conformant
EAL 5 augmented by ALC_DVS.2 and AVA_VAN.5

For specific evaluation results regarding the development and production environment see annex B in part D of this report.

The results of the evaluation are only applicable to the TOE as defined in chapter 2 and the configuration as outlined in chapter 8 above.

9.2. Results of cryptographic assessment

The strength of the cryptographic algorithms was not rated in the course of this certification procedure (see BSIG Section 9, Para. 4, Clause 2). But Cryptographic Functionalities with a security level of lower than 100 bits can no longer be regarded as secure without considering the application context. Therefore, for these functionalities it shall be checked whether the related crypto operations are appropriate for the intended system. Some further hints and guidelines can be derived from the 'Technische Richtlinie BSI TR-02102' (<https://www.bsi.bund.de>).

An overview over the provided cryptographic functionalities is given in the Security Target [6] (table 17) and [9] in table 16. Any Cryptographic Functionality therein, that is marked with with 'no' in the dedicated column '*Security Level above 100 Bits*', achieves a security level of lower than 100 Bits (in general context).

10. Obligations and Notes for the Usage of the TOE

The documents as outlined in table 2 contain necessary information about the usage of the TOE and all security hints therein have to be considered. In addition all aspects of Assumptions, Threats and OSPs - as outlined in the Security Target - not covered by the TOE itself need to be fulfilled by the operational environment of the TOE.

The customer or user of the product shall consider the results of the certification within his system risk management process. In order for the evolution of attack methods and techniques to be covered, he should define the period of time until a re-assessment of the TOE is required and thus requested from the sponsor of the certificate.

Some security measures are partly implemented in this certified TOE, but require additional configuration or control or measures to be implemented by a product layer on top, e.g. the Embedded Software using the TOE. For this reason the TOE includes guidance documentation (see table 2) which contains obligations and guidelines for the developer of the product layer on top on how to securely use this certified TOE and which measures have to be implemented in order to fulfil the security requirements of the Security Target of the TOE. In the course of the evaluation of the composite product or system it must be examined if the required measures have been correctly and effectively implemented by the product layer on top. Additionally, the evaluation of the composite product or system must also consider the evaluation results as outlined in the document ETR for composite evaluation [10].

In addition, the following aspects need to be fulfilled when using the TOE:

- All security hints described in the delivered documents [12] - [17] and [19] have to be considered.

The Composite Product Manufacturer receives all necessary recommendations and hints to develop his software in form of the delivered documentation.

- All security hints described in [18] have to be considered.

In addition the following hint resulting from the evaluation of the ALC evaluation aspect has to be considered:

- The IC Embedded Software Developer can deliver his software either to Infineon to let them implement it in the TOE (in Flash memory) or to the Composite Product Manufacturer to let him download the software in the Flash memory.
- The delivery procedure from the IC Embedded Software Developer to the Composite Product Manufacturer is not part of this evaluation and a secure delivery is required.

11. Security Target

For the purpose of publishing, the Security Target [9] of the Target of Evaluation (TOE) is provided within a separate document as Annex A of this report. It is a sanitised version of the complete Security Target [6] used for the evaluation performed. Sanitisation was performed according to the rules as outlined in the relevant CCRA policy (see AIS 35 [4]).

12. Definitions

12.1. Acronyms

AES	Advanced Encryption Standard
AIS	Application Notes and Interpretations of the Scheme
APB™	Advanced Peripheral Bus
APDU	Application Protocol Data Unit
API	Application Programming Interface
AXI™	Advanced eXtensible Interface Bus Protocol
BPU	Bill Per Use
BSI	Bundesamt für Sicherheit in der Informationstechnik / Federal Office for Information Security, Bonn, Germany
BOS	Boot Software
BSIG	BSI-Gesetz / Act on the Federal Office for Information Security
CC	Common Criteria for IT Security Evaluation
CEM	Common Methodology for Information Technology Security Evaluation
CPU	Central Processing Unit
CCRA	Common Criteria Recognition Arrangement
Crypto2304T	Asymmetric Cryptographic Processor
CRC	Cyclic Redundancy Check
CRT	Chinese Remainder Theorem
DES	Data Encryption Standard; symmetric block cipher algorithm
DPA	Differential Power Analysis
DFA	Differential Failure Analysis
EAL	Evaluation Assurance Level
EC	Elliptic Curve Cryptography

ECC	Error Correction Code
ECDH	Elliptic Curve Diffie–Hellman
ECDSA	Elliptic Curve Digital Signature Algorithm
EDC	Error Detection Code
EDU	Error Detection Unit
EEPROM	Electrically Erasable and Programmable Read Only Memory
EMA	Electro Magnetic Analysis
ETR	Evaluation Technical Report
Flash EEPROM	Flash Memory
FL	Flash Loader software
FTL	Flash Translation Layer
FW	Firmware
GCIM	Generic Chip Identification Mode
GPIO	General Purpose IO
HW	Hardware
IC	Integrated Circuit
ID	Identification
IT	Information Technology
ITSEF	Information Technology Security Evaluation Facility
I/O	Input/Output
IRAM	Internal Random Access Memory
MED	Memory Encryption and Decryption
MMU	Memory Management Unit
NVM	Non-Volatile Memory
OS	Operating system
PP	Protection Profile
PRNG	Pseudo Random Number Generator
PROM	Programmable Read Only Memory
RAM	Random Access Memory
RMS	Resource Management System
RNG	Random Number Generator
ROM	Read Only Memory
RSA	Rives-Shamir-Adleman Algorithm
SAM	Service Algorithm Minimal
SAR	Security Assurance Requirement

SCP	Symmetric Cryptographic Processor
SF	Security Feature
SFP	Security Functional Policy
SFR	Special Function Register, as well as Security Functional Requirement, the specific meaning is given in the context
SOLID FLASH™	An Infineon Trade Mark and Stands for Flash EEPROM Technology
SPA	Simple Power Analysis
SPI	Serial Peripheral Interface
SSC	Synchronous Serial Communication
ST	Security Target
STS	Self Test Software
SW	Software
SO	Security Objective
SWP	Single Wire Protocol
TOE	Target of Evaluation
TM	Test Mode (STS)
TSF	TOE Security Functions
TRNG	True Random Number Generator
TSC	TOE Security Functions Control
TSF	TOE Security Functionality
UART	Universal Asynchronous Receiver/Transmitter
UM	User Mode (STS)
UmSLC	User Mode Security Life Control
WLP	Wafer Level Package
3DES	Triple DES Encryption Standards

12.2. Glossary

Augmentation - The addition of one or more requirement(s) to a package.

Collaborative Protection Profile - A Protection Profile collaboratively developed by an International Technical Community endorsed by the Management Committee.

Extension - The addition to an ST or PP of functional requirements not contained in CC part 2 and/or assurance requirements not contained in CC part 3.

Formal - Expressed in a restricted syntax language with defined semantics based on well-established mathematical concepts.

Informal - Expressed in natural language.

Object - A passive entity in the TOE, that contains or receives information, and upon which subjects perform operations.

Package - named set of either security functional or security assurance requirements

Protection Profile - A formal document defined in CC, expressing an implementation independent set of security requirements for a category of IT Products that meet specific consumer needs.

Security Target - An implementation-dependent statement of security needs for a specific identified TOE.

Semiformal - Expressed in a restricted syntax language with defined semantics.

Subject - An active entity in the TOE that performs operations on objects.

Target of Evaluation - An IT Product and its associated administrator and user guidance documentation that is the subject of an Evaluation.

TOE Security Functionality - Combined functionality of all hardware, software, and firmware of a TOE that must be relied upon for the correct enforcement of the SFRs.

C. Excerpts from the Criteria

CC Part 1:

Conformance Claim (chapter 10.4)

“The conformance claim indicates the source of the collection of requirements that is met by a PP or ST that passes its evaluation. This conformance claim contains a CC conformance claim that:

- describes the version of the CC to which the PP or ST claims conformance.
- describes the conformance to CC Part 2 (security functional requirements) as either:
 - **CC Part 2 conformant** - A PP or ST is CC Part 2 conformant if all SFRs in that PP or ST are based only upon functional components in CC Part 2, or
 - **CC Part 2 extended** - A PP or ST is CC Part 2 extended if at least one SFR in that PP or ST is not based upon functional components in CC Part 2.
- describes the conformance to CC Part 3 (security assurance requirements) as either:
 - **CC Part 3 conformant** - A PP or ST is CC Part 3 conformant if all SARs in that PP or ST are based only upon assurance components in CC Part 3, or
 - **CC Part 3 extended** - A PP or ST is CC Part 3 extended if at least one SAR in that PP or ST is not based upon assurance components in CC Part 3.

Additionally, the conformance claim may include a statement made with respect to packages, in which case it consists of one of the following:

- Package name Conformant - A PP or ST is conformant to a pre-defined package (e.g. EAL) if:
 - the SFRs of that PP or ST are identical to the SFRs in the package, or
 - the SARs of that PP or ST are identical to the SARs in the package.
- Package name Augmented - A PP or ST is an augmentation of a predefined package if:
 - the SFRs of that PP or ST contain all SFRs in the package, but have at least one additional SFR or one SFR that is hierarchically higher than an SFR in the package.
 - the SARs of that PP or ST contain all SARs in the package, but have at least one additional SAR or one SAR that is hierarchically higher than an SAR in the package.

Note that when a TOE is successfully evaluated to a given ST, any conformance claims of the ST also hold for the TOE. A TOE can therefore also be e.g. CC Part 2 conformant.

Finally, the conformance claim may also include two statements with respect to Protection Profiles:

- PP Conformant - A PP or TOE meets specific PP(s), which are listed as part of the conformance result.
- Conformance Statement (Only for PPs) - This statement describes the manner in which PPs or STs must conform to this PP: strict or demonstrable. For more information on this Conformance Statement, see Annex D.”

CC Part 3:

Class APE: Protection Profile evaluation (chapter 10)

“Evaluating a PP is required to demonstrate that the PP is sound and internally consistent, and, if the PP is based on one or more other PPs or on packages, that the PP is a correct instantiation of these PPs and packages. These properties are necessary for the PP to be suitable for use as the basis for writing an ST or another PP.

Assurance Class	Assurance Components

Table 5: Assurance class decomposition

Evaluation assurance levels (chapter 8)

“The Evaluation Assurance Levels (EALs) provide an increasing scale that balances the level of assurance obtained with the cost and feasibility of acquiring that degree of assurance. The CC approach identifies the separate concepts of assurance in a TOE at the end of the evaluation, and of maintenance of that assurance during the operational use of the TOE.

It is important to note that not all families and components from CC Part 3 are included in the EALs. This is not to say that these do not provide meaningful and desirable assurances. Instead, it is expected that these families and components will be considered for augmentation of an EAL in those PPs and STs for which they provide utility.”

Evaluation assurance level (EAL) overview (chapter 8.1)

“Table 1 represents a summary of the EALs. The columns represent a hierarchically ordered set of EALs, while the rows represent assurance families. Each number in the resulting matrix identifies a specific assurance component where applicable.

As outlined in the next Section, seven hierarchically ordered evaluation assurance levels are defined in the CC for the rating of a TOE’s assurance. They are hierarchically ordered inasmuch as each EAL represents more assurance than all lower EALs. The increase in assurance from EAL to EAL is accomplished by substitution of a hierarchically higher assurance component from the same assurance family (i.e. increasing rigour, scope, and/or depth) and from the addition of assurance components from other assurance families (i.e. adding new requirements).

These EALs consist of an appropriate combination of assurance components as described in Chapter 7 of this CC Part 3. More precisely, each EAL includes no more than one

component of each assurance family and all assurance dependencies of every component are addressed.

While the EALs are defined in the CC, it is possible to represent other combinations of assurance. Specifically, the notion of “augmentation” allows the addition of assurance components (from assurance families not already included in the EAL) or the substitution of assurance components (with another hierarchically higher assurance component in the same assurance family) to an EAL. Of the assurance constructs defined in the CC, only EALs may be augmented. The notion of an “EAL minus a constituent assurance component” is not recognised by the standard as a valid claim. Augmentation carries with it the obligation on the part of the claimant to justify the utility and added value of the added assurance component to the EAL. An EAL may also be augmented with extended assurance requirements.

Evaluation assurance level 1 (EAL 1) - functionally tested (chapter 8.3)

“Objectives

EAL 1 is applicable where some confidence in correct operation is required, but the threats to security are not viewed as serious. It will be of value where independent assurance is required to support the contention that due care has been exercised with respect to the protection of personal or similar information.

EAL 1 requires only a limited security target. It is sufficient to simply state the SFRs that the TOE must meet, rather than deriving them from threats, OSPs and assumptions through security objectives.

EAL 1 provides an evaluation of the TOE as made available to the customer, including independent testing against a specification, and an examination of the guidance documentation provided. It is intended that an EAL 1 evaluation could be successfully conducted without assistance from the developer of the TOE, and for minimal outlay.

An evaluation at this level should provide evidence that the TOE functions in a manner consistent with its documentation.”

Evaluation assurance level 2 (EAL 2) - structurally tested (chapter 8.4)

“Objectives

EAL 2 requires the co-operation of the developer in terms of the delivery of design information and test results, but should not demand more effort on the part of the developer than is consistent with good commercial practise. As such it should not require a substantially increased investment of cost or time.

EAL 2 is therefore applicable in those circumstances where developers or users require a low to moderate level of independently assured security in the absence of ready availability of the complete development record. Such a situation may arise when securing legacy systems, or where access to the developer may be limited.”

Evaluation assurance level 3 (EAL 3) - methodically tested and checked (chapter 8.5)

“Objectives

EAL 3 permits a conscientious developer to gain maximum assurance from positive security engineering at the design stage without substantial alteration of existing sound development practises.

EAL 3 is applicable in those circumstances where developers or users require a moderate level of independently assured security, and require a thorough investigation of the TOE and its development without substantial re-engineering.”

Evaluation assurance level 4 (EAL 4) - methodically designed, tested, and reviewed (chapter 8.6)

“Objectives

EAL 4 permits a developer to gain maximum assurance from positive security engineering based on good commercial development practises which, though rigorous, do not require substantial specialist knowledge, skills, and other resources. EAL 4 is the highest level at which it is likely to be economically feasible to retrofit to an existing product line.

EAL 4 is therefore applicable in those circumstances where developers or users require a moderate to high level of independently assured security in conventional commodity TOEs and are prepared to incur additional security-specific engineering costs.”

Evaluation assurance level 5 (EAL 5) - semiformally designed and tested (chapter 8.7)

“Objectives

EAL 5 permits a developer to gain maximum assurance from security engineering based upon rigorous commercial development practises supported by moderate application of specialist security engineering techniques. Such a TOE will probably be designed and developed with the intent of achieving EAL 5 assurance. It is likely that the additional costs attributable to the EAL 5 requirements, relative to rigorous development without the application of specialised techniques, will not be large.

EAL 5 is therefore applicable in those circumstances where developers or users require a high level of independently assured security in a planned development and require a rigorous development approach without incurring unreasonable costs attributable to specialist security engineering techniques.”

Evaluation assurance level 6 (EAL 6) - semiformally verified design and tested (chapter 8.8)

“Objectives

EAL 6 permits developers to gain high assurance from application of security engineering techniques to a rigorous development environment in order to produce a premium TOE for protecting high value assets against significant risks.

EAL 6 is therefore applicable to the development of security TOEs for application in high risk situations where the value of the protected assets justifies the additional costs.”

Evaluation assurance level 7 (EAL 7) - formally verified design and tested (chapter 8.9)

“Objectives

EAL 7 is applicable to the development of security TOEs for application in extremely high risk situations and/or where the high value of the assets justifies the higher costs. Practical application of EAL 7 is currently limited to TOEs with tightly focused security functionality that is amenable to extensive formal analysis.”

Assurance Class	Assurance Family	Assurance Components by Evaluation Assurance Level						
		EAL 1	EAL 2	EAL 3	EAL 4	EAL 5	EAL 6	EAL 7

Table 6: Evaluation assurance level summary”

Class AVA: Vulnerability assessment (chapter 16)

“The AVA: Vulnerability assessment class addresses the possibility of exploitable vulnerabilities introduced in the development or the operation of the TOE.”

Vulnerability analysis (AVA_VAN) (chapter 16.1)

“Objectives

Vulnerability analysis is an assessment to determine whether potential vulnerabilities identified, during the evaluation of the development and anticipated operation of the TOE or by other methods (e.g. by flaw hypotheses or quantitative or statistical analysis of the security behaviour of the underlying security mechanisms), could allow attackers to violate the SFRs.

Vulnerability analysis deals with the threats that an attacker will be able to discover flaws that will allow unauthorised access to data and functionality, allow the ability to interfere with or alter the TSF, or interfere with the authorised capabilities of other users.”

D. Annexes

Annex B of Certification Report BSI-DSZ-CC-0946-V3-2017

Evaluation results regarding development and production environment

The IT product Infineon Technologies Smart Card IC (Security Controller) M5072 with optional RSA v1.03.006/v2.06.003, EC v1.03.006/ v2.06.003, Toolbox v1.03.006/ v2.06.003, SCL v2.02.010 libraries with specific IC dedicated software (Target of Evaluation, TOE) has been evaluated at an approved evaluation facility using the Common Methodology for IT Security Evaluation (CEM), Version 3.1 extended by Scheme Interpretations by advice of the Certification Body for components beyond EAL 5 and CC Supporting Documents for conformance to the Common Criteria for IT Security Evaluation (CC), Version 3.1.

As a result of the TOE certification, dated 18 August 2017, the following results regarding the development and production environment apply. The Common Criteria assurance requirements ALC – Life cycle support (i.e. ALC_CMC.4, ALC_CMS.5, ALC_DEL.1, ALC_DVS.2, ALC_LCD.1 and ALC_TAT.2) are fulfilled for the development and production sites of the TOE listed below:

Functions of site	Company name and address

Table 7: Relevant development/production sites

For the sites listed above, (if applicable) the requirements have been specifically applied in accordance with the Security Target [6] and [9]. The evaluators verified (if applicable), that the threats, security objectives and requirements for the TOE life cycle phases up to delivery (as stated in the Security Target [6] and [9]) are fulfilled by the procedures of these sites.
