

# MultiApp V5.1 Javacard Platform GP-SE

(Global Platform - Security Element)

Common Criteria / ISO 15408 Security Target – Public version EAL6+

Version 1.25 – 04th, October 2023

# Contents

| 1 | SECURITY TARGET INTRODUCTION                                   | 9  |
|---|--|----|
|   | 1.1 Security target reference                                  | Q  |
|   | 1.2 TOE reference  |    |
|   | 1.3 TOE IDENTIFICATION   |    |
|   | 1.4 Security target overview                                   |    |
|   | 1.5 References   |    |
|   | 1.5.1 External References                                      | 12 |
|   | 1.5.2 Internal References [IR]                                 | 14 |
|   | 1.6 ACRONYMS AND GLOSSARY                                      | 15 |
| 2 | TOE OVERVIEW   | 16 |
|   | 2.1 TOE TYPE   | 16 |
|   | 2.2 Product Architecture                                       |    |
|   | 2.3 TOE BOUNDARIES   |    |
|   | 2.4 TOE description  |    |
|   | 2.4.1 Architecture   |    |
|   | 2.4.2 Modularity optionality concept                           |    |
|   | 2.4.3 Agility concept  |    |
|   | 2.4.4 Architecture: design view by features                    | 22 |
|   | 2.5 Life-cycle   | 23 |
|   | 2.5.1 Product Life-cycle                                       | 23 |
|   | 2.5.1.1 Actors   |    |
|   | 2.5.1.2 Life cycle description                                 |    |
|   | 2.5.2 TOE Life-cycle   |    |
|   | 2.5.3 GP Life-cycle  |    |
|   | 2.5.4 Involved Thales-DIS sites                                |    |
|   | 2.6 TOE INTENDED USAGE   |    |
|   | 2.6.2 Usage Phase  |    |
|   | 2.6.2.1 NON-TOE HARDWARE/SOFTWARE/FIRMWARE REQUIRED BY THE TOE |    |
|   | 2.6.2.2 TOE Delivery   |    |
| 3 | CONFORMANCE CLAIMS   | 30 |
|   | 3.1 CC CONFORMANCE CLAIMS                                      | 30 |
|   | 3.2 PP CLAIM   |    |
|   | 3.3 [PP-GP] CONFORMANCE CLAIM RATIONAL WITH [PP-JCS-OPEN]      |    |
|   | 3.3.1 SPD Consistency  |    |
|   | 3.3.1.1 Assets   |    |
|   | 3.3.1.2 Users and Subjects                                     | 31 |
|   | 3.3.1.3 Threats  |    |
|   | 3.3.1.4 Organizational Security Policy (OSP)                   |    |
|   | 3.3.1.5 Assumptions  |    |
|   | 3.3.2.1 Security Objectives for the TOE                        |    |
|   | 3.3.2.2 Security Objectives for the environment.               |    |
|   | 3.3.3 SFRs and SARs Consistency Statements                     |    |
|   | 3.3.3.1 Consistency of Policies                                | 36 |
|   | 3.3.3.2 Consistency of SFRs                                    |    |
|   | 3.3.3.3 SARs' Consistency                                      |    |
|   | 3.4 PACKAGE CLAIM  |    |
| 4 | 3.5 CONFORMANCE STATEMENT                                      |    |
| 4 |  |    |
|   | 4.1 CONFIDENTIALITY  |    |
|   | 4.2 Integrity  |    |
|   | 4.3 UNAUTHORIZED EXECUTIONS                                    |    |
|   | 4.4 BYTECODE VERIFICATION                                      |    |
|   | 4.4.1 CAP file Verification                                    |    |
|   | 4.4.2 Integrity and Authentication                             | 41 |

| 4.4.3           | Linking and Verification  | 41 |

# 1 SECURITY TARGET INTRODUCTION

## 1.1 SECURITY TARGET REFERENCE

| Title:                             | MultiApp V5.1: GP-SE Security Target                               |
|------------------------------------|--|
| Version :                          | 1.25   |
| ST Reference :                     | D1569436_LITE  |
| Origin :                           | Thales   |
| IT Security Evaluation Facility :  | LETI   |
| IT Security Certification scheme : | Agence Nationale de la Sécurité des Systèmes d'Information (ANSSI) |

## 1.2 TOE REFERENCE

The product is available in two configurations:

- Configuration 1: TOE based on the IC AQUARIUS\_BA\_09- AQUARIUS\_v1 called "revision B"
- Configuration 2: TOE based on the IC AQUARIUS\_CA\_09- AQUARIUS\_v2 called "revision C"

| Product Technical Name :  | MultiApp V5.1  |  |  |
|---------------------------|--|--|--|
| Product Commercial Names: | MultiApp V5.1  |  |  |
| Security Controllers :    | For the configuration 1 (Revision B):  AQUARIUS_BA_09 (Thales DIS France SAS)  For the configuration 2 (Revision C):  AQUARIUS_CA_09 (Thales DIS France SAS) |  |  |
| TOE Name :                | MultiApp V5.1 GP-SE Platform   |  |  |
| TOE Version :             | For the configuration 1 (Revision B): 5.1 revision B (0x3055)  For the configuration 2 (Revision C): 5.1 revision C (0x3055)                                 |  |  |
| TOE documentation:        | Guidance [ AGD ]   |  |  |
| Composition elements:     |  |  |  |
| Composite TOE identifier: | For the configuration 1:  AQUARIUS_BA_09 - AQUARIUS_v1  For the configuration 2:  AQUARIUS_CA_09 - AQUARIUS_v2   |  |  |
| Composite TOE Version:    | For the configuration 1 (Revision B):  Hardware revision: B  |  |  |
|                           | For the configuration 2 (Revision C):  Hardware revision: C  |  |  |
|                           | For both configurations:  Platform ROM Firmware Revision: A  Platform FLASH Firmware Revision: 09  > BIOS: Version 1.0-911  > Loader: Version 2.2            |  |  |

#### 1.3 TOE IDENTIFICATION

The TOE identification is provided by the Tag identity and CPLC data. These data are available by executing a dedicated command described in [AGD-OPE] and here below:

The TOE can be identified through the Get Data Command response with tag "0103", as follows:

| Name                                 | Length | Description              | Value  | Participate to TOE identification |
|--------------------------------------|--------|--------------------------|--|-----------------------------------|
| Thales Family Name                   | 1      | Java Card                | 0xB0   | YES                               |
| Thales OS name                       | 1      | MultiApp                 | 0x85   | YES                               |
| Thales Mask Number                   | 1      | MultiappV5.1             | 0x68   | YES                               |
| Thales Product Name                  | 1      |                          | 0x6A   | YES                               |
| Flow id Version                      | 1      |                          | 0x01   | YES                               |
| Filter set                           | 1      |                          | 0x00   | YES                               |
| Chip Manufacturer                    | 2      | THALES DIS<br>France SAS | 0x1290   | YES                               |
| Chip Identifier                      | 2      | Identifier               |  | NO                                |
| BPU                                  | 2      | BPU configuration        |  | NO                                |
| PDM TP                               | 3      |                          |  | NO                                |
| PDM CI                               | 3      |                          |  | NO                                |
| Feature FLag – Crypto Config         | 2      | See after                |  | NO                                |
| Feature Flag – Feature Config byte 1 | 1      | See after                |  | NO                                |
| Feature Flag – Feature Config byte 2 | 1      | See after                |  | NO                                |
| Platform Certificates                | 1      |                          | Bit 7 (0x040): CC Configuration                                      | YES<br>(only for bit 7)           |
| APPLI CERTIFICATES byte 1            | 1      |                          | Bit 8 (0x80): eTravel<br>Bit 7 (0x40): IAS<br>Bit 6-1 : Not used (0) | YES (only for bits 8 & 7)         |
| APPLI CERTIFICATES byte 2            | 1      |                          | 00h  | NO                                |

Note: the eight first bytes of this table (from "Thales Family Name" to "Chip Identifier") are used for traceability purpose. Also, using Get data command with tag 9F7F for product identification:

| Name                           | length | Description       | Value     | Participate to TOE identification |
|--------------------------------|--------|-------------------|-----------|-----------------------------------|
| IC Fabricator                  | 2      | Chip fabricator   | 0x12 0x90 | YES                               |
| IC Type                        | 2      | Chip model number | 0x00 0x13 | YES                               |
| Operating system identifier    | 2      | OS developer      | 0x19 0x81 | YES                               |
| Operating system release date  | 2      | Date reference    | 0x30 0x55 | YES                               |
| Operating system release level | 2      | 5.1               | 0x05 0x10 | YES                               |

To identify the configuration: Use the Get data command with tag 010B for product identification

| Index | Description      | IC Revision B<br>Value (Previous) | IC Revision C<br>Value | Part of TOE the identification |
|-------|------------------|-----------------------------------|------------------------|--------------------------------|
| 0     | PRODUCT          | 0x09                              | 0x09                   | No                             |
| 1     | HW_REV           | 0x42                              | 0x43                   | Yes                            |
| 2     | Not relevant for |                                   |                        | No                             |
|       | identification   |                                   |                        | No                             |
| 15    | identification   |                                   |                        | No                             |

The TOE and the product differ, as further explained in Architecture of the product

- The TOE is the JCS open platform of the MultiApp V5.1 product.
- The MultiApp V5.1 product also includes applets.

Table 1: MAV 5.1 Features configuration

Note 1: X with value 1 when the feature is available, X with value 0 when the feature is not available. Note 2: The bits that are not listed in the table 1 are considered as RFU

The TOE and the product differ, as further explained in Architecture of the product

- The TOE is the JCS open platform of the MultiApp V5.1 product.
- The MultiApp V5.1 product also includes applets.

#### 1.4 SECURITY TARGET OVERVIEW

The main objectives of this ST are:

- To introduce TOE and the JCS Platform,
- To define the scope of the TOE and its security features,
- To describe the security environment of the TOE, including the assets to be protected and the threats to be countered by the TOE and its environment during the product development, production and usage.
- To describe the security objectives of the TOE and its environment supporting in terms of integrity and confidentiality of application data and programs and of protection of the TOE.
- To specify the security requirements which includes the TOE security functional requirements, the TOE assurance requirements and TOE security functions.

# 2 TOE OVERVIEW

#### 2.1 TOETYPE

The Java Card technology combines a subset of the Java programming language with a runtime environment optimized for smart cards and similar small-memory embedded devices [JCVM3]. The Java Card platform is a smart card platform enabled with Java Card technology (also called a "Java card"). This technology allows for multiple applications to run on a single card and provides facilities for secure interoperability of applications. Applications for the Java Card platform ("Java Card applications") are called applets.

This TOE provides the security of an EAL6+ evaluated card with the flexibility of an open platform. It allows for the loading of applets before or after the issuance of the card. These applets MAY or MAY NOT be evaluated on this platform.

The applications using only certified applets will BE certified even if NOT-certified applets are loaded on the platform.

The applications using a NOT-certified applet will NOT BE certified.

The Issuer can forbid the loading of applets before or after the issuance of the card.

#### 2.2 PRODUCT ARCHITECTURE

The TOE is part of the *MultiApp V5.1* smartcard product. This smartcard contains the software dedicated to the operation of:

The MultiApp V5.1 Platform, which supports the execution of the personalized applets and provides the smartcard administration services. It is conformant to Java Card 3.1 and GP 2.3.1 standards [GP23]. (With common configuration 2.1 [GP23 Com]) and with GP Privacy Framework v1.0.1 [GP PF].

The identity applets: GDP, IAS classic V5.2.1, eTravel v3.1, BioPin Manager v3.1 (MOCA server/client), MPCOS v4.1, MSFT PnP v1.0, FIDO Authentificator v2.1 applet, LDSv2 v1.1, PURE DI v3.6.0, TachoG2V2, BelPIC v1.8, Privacy Manager v1.0.

| Applet name                     | Package                         | Package AID                     |

| TachoG2V2                       | com.gemalto.tacho               | A00000030800000000A2800FF       |
| BelPIC v1.8                     | com.gemalto.belpic              | A000000308000000043417          |
| Privacy Manager v1.0            | com.gemalto.javacard.eid        | A000000308000000008DB00FF       |
| MPCOS v4.1                      | com.gemalto.mpcos               | A0000001830030100000000000000FF |
| FIDO Authentificator 2.1        | com.gemalto.javacard.fido.ctap  | A00000030800000000A9A00FF       |

- Additionally, other applets not determined at the moment of the present evaluation may be loaded on the smartcard before or after issuance.
- A cryptographic library developed by Thales

## Configuration 1 (Revision B):

ST

Therefore, the architecture of the smartcard software and application data can be represented as follows:

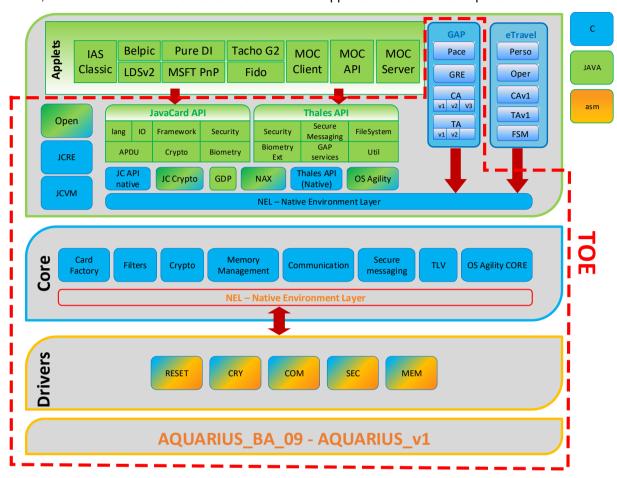

Figure 1: MultiApp V5.1 smartcard architecture for configuration 1 (revision B)

#### Configuration 1 (Revision C):

Therefore, the architecture of the smartcard software and application data can be represented as follows:

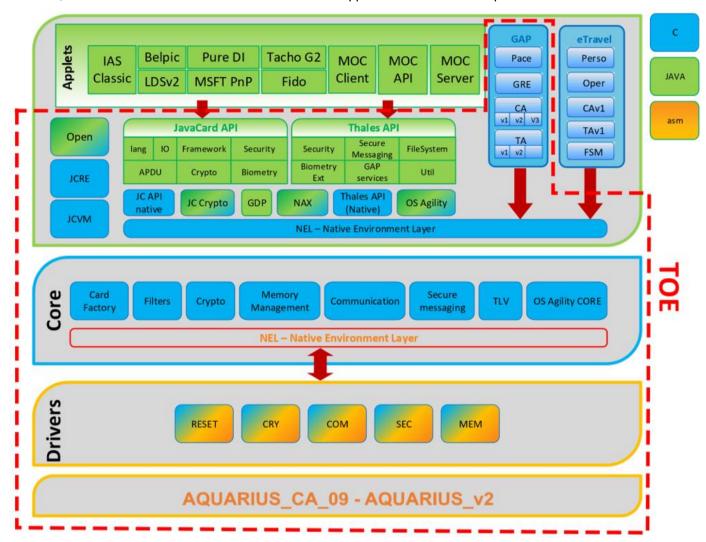

Figure 2: MultiApp V5.1 smartcard architecture for configuration 2 (revision C)

Applets and the MultiApp V5.1 Java Card platform, are located in flash code area.

All the data (related to the applets or to the Java Card platform) are located in flash data area. The separation between these data is ensured by the Java Card firewall as specified in [JCRE3].

MultiApp V5.1 products is a modular product where some features could be removed, based on the customer needs. (See identification and configuration option).

#### 2.3 TOE BOUNDARIES

ST

The Target of Evaluation (TOE) is the JCS open platform of the MultiApp V5.1 product. It is defined by:

The Java Platform 3.1 based on JLEP3 Operating System

The PACE module to provide PACE secure channel

The underlying Integrated Circuit

Applications stored in Flash mask in code area in MultiApp V5.1, are outside the TOE.

The Applets loaded pre issuance or post issuance are outside the TOE, Other smart card product elements, (such as holograms, magnetic stripes, security printing) are outside the scope of this Security Target.

Java Card RMI is not implemented in the TOE.

#### 2.4 TOE DESCRIPTION

#### 2.4.1 Architecture

The MultiApp V5.1 platform is an operating system that complies with two major industry standards:

- Sun's Java Card 3.1, which consists of the Java Card 3.1 Virtual Machine [JCVM3], the Java Card 3.1 Runtime Environment [JCRE3] and the Java Card 3.1 Application Programming Interface [JCAPI3].
- The Global Platform Card Specification version 2.3 [GP23]
- GAP: the General Authentication Procedure, for compliance with latest version of [TR03110-2]
- GAP and File System APIs: these new APIs are required for the [TR03110-2] based applications (elDAS and new Signature application compliant to [TRSIGN]).
- GDP: Global Dispatcher Perso application to centralize application personalization (at first for eTravel).
- Support of Flash Modularity: possibility during product construction to embed only features required for a given customer item.

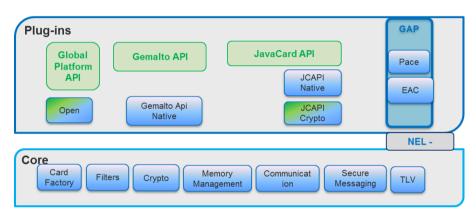

Figure 3: MultiApp V5.1 Java Card platform architecture

As described in figure 2, the MultiApp V5.1 platform contains the following components:

#### The Core layer

The Core layer remains unaffected as the basic smart card services (softmasks/filters, communication protocols, memory management, secure messaging) remain the same.

It provides the basic card functionalities (memory management, I/O management and cryptographic primitives) with native interface with the underlying IC. The cryptographic features implemented in the native layer encompass the following algorithms:

- o DES, 3DES (ECB, CBC)
- RSA up to 4096 (CRT method & public Std method), 4096 (Std private method)
- DH up to 2048
- o AES 128, 192, 256
- o SHA1, SHA 2 (224, 256, 384, 512), SHA3 (224, 256, 384, 512)
- ECC (ECDSA et ECDH) up to 521
- PACE DH up to 2048 Integrated Mapping, Generic Mapping
- PACE ECDH up to 521 Integrated Mapping, Generic Mapping
- Pseudo-Random Number Generation (PRNG) & Software random
- Pseudonymous signature (Psign) ECC up to 521 (not evaluated) (Out of TOE evaluation)
- o CRC16
- o CRC32
- HMAC SHA1, SHA 2 (up to 512)

■ The Plug-ins layer

#### ■ The Javacard Runtime Environment

It conforms to [JCRE3] and provides a secure framework for the execution of the Java Card programs and data access management (firewall).

Among other features, multiple logical channels are supported, as well as extradition, DAP, Delegated management, SCP01, SCP02 and SCP03.

### ■ The Javacard Virtual Machine

It conforms to [JCVM3] and provides the secure interpretation of bytecodes.

#### The API

ST

It includes the standard Java Card API [JCAPI3] and the Thales proprietary API.

#### The Global Platform Issuer Security Domain

It conforms to [GP23] and provides card, key and applet management functions (contents and life-cycle) and security control.

#### The GAP component

GAP is an extension of PACE, it provides additional commands terminal authenticate (TA) and Chip Authenticate (CA). This provides mutual authentication, secure messaging channel, authorization verified by application through specific API.

The MultiApp V5.1 platform provides the following services:

- Initialization of the Card Manager and management of the card life cycle
- Secure loading and installation of the applets under Security Domain control
- Deletion of applications under Security Domain control
- Extradition services to allow several applications to share a dedicated Security Domain
- Secure operation of the applications through the API
- Management and control of the communication between the card and the CAD
- Application life cycle management
- Card basic security services as follows:
  - Checking environmental operating conditions using information provided by the IC
  - Checking life cycle consistency
  - Ensuring the security of the PIN and cryptographic key objects
  - o Generating random numbers
  - Handling secure data object and backup mechanisms
  - Managing memory content
  - o Ensuring Java Card firewall mechanism

## 2.4.2 Modularity optionality concept

The MultiApp product family relies on JLEP3 OS design. The JLEP3 OS provides modularity by design. By modularity, we understand a split of the code in sub-systems, each sub-system being broken down in another set of sub-system or modules, a module being an identified list of compilation units (java, c or assembly file).

The modularity is ensured by a functional consistency of functions regrouped in the organizational units (compilation unit, module or sub-system). The modularity can be measured through the amount of dependencies across organizational units. A modular design ensures minimal dependency.

The objective is to benefit from the migration to Flash technology so that the actual generated customer item (derived from the generic product) would embed only features required and hence have an optimal memory footprint.

#### Flash

The solution relies on the tower concept: when building (compiling and linking) the product, the modules are combined in features. The features are assembled like bricks in towers as illustrated here:

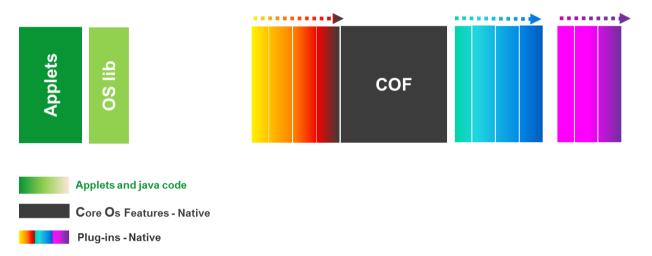

Figure 4: Flash Modularity towers concept

Towers can be shrunk by removing features one-by-one, starting from the top of the tower (from the left on this figure), thus achieving a reduced memory footprint. It is not possible to remove a feature when the feature above it is present. This brings particular constraints to the way the features must be assembled. Typically, features in the upper layers should be the ones with no dependencies on them in order to be removable. Features in the lower layers may have dependencies only from features of layers above them. This also explains why we have core feature: they constitute the irremovable heart of the tower.

#### Note:

ST

The diagram above in <u>Figure 3 - Flash Modularity towers concept</u> illustrates the <u>virtual</u> memory layout of a product release as generated by the chip manufacturer's compiler/linker tool chain. As a result, it requires managing the module/feature mapping to ensure the features are assembled as expected.

## 2.4.3 Agility concept

ST

The MultiAppV5.1 product embeds an optional functionality to update the operating system when the card is already on the field. This functionality is named OS-agility.

The mechanism will allow to correct product issues and security issues when the product is already deployed. The updates are done through a dedicated application (OS-Agility Plug-in see figure 4) and are a list of instructions to update the memory.

The update instructions are packaged into a block protected in confidentiality and integrity by keys known only by Thales DIS. The block can be transmitted and executed by the card only after a successful authentication done with keys only known by the customer. Like this Thales DIS is unable to load some contents into the card without the consent of the customer and the customer also cannot load a content without the consent of Thales DIS.

The patch is transmitted to the card throw a trusted channel that can be manage by the OS agility application or thanks to the certificate update mechanism managed by the eTravel application.

Prior the execution of the instructions of the patch, some prerequisites are verified, the code ensures that the current product configuration allows the correct execution of the instructions. Some updates can be conditionally be executed following the availability of a dedicated feature (cf modularity concept in §2.4.2). At the end of the execution, the traceability elements are also updated to allow a complete identification of the product (platform version and current patch version). The patch loading mechanism ensures also the atomicity of the updates.

## 2.4.4 Architecture: design view by features

It is important to distinguish the functional design view of the platform, described in chapter 2.4.1, from the representation of the products features. Design sub-systems and features have a common definition: they are a collection of modules. Sub-systems are a design group, while features are functional groups of modules.

The following diagram shows a high level representation of the MultiApp architecture by feature:

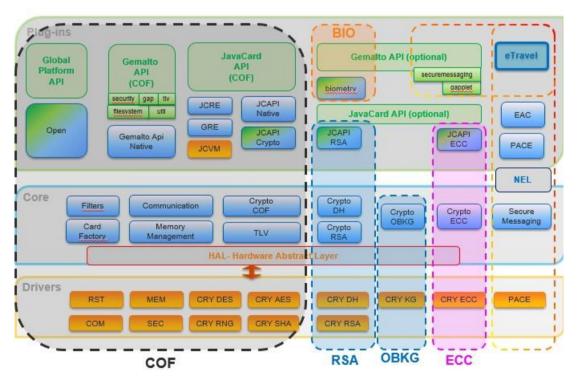

Figure 5: MultiApp design by features

Note that the COF (Core Operating Feature) shows all the mandatory features, other elements are consider as additional bricks. These bricks could be removed.

## 2.5 LIFE-CYCLE

# 2.5.1 Product Life-cycle

# 2.5.1.1 Actors

ST

| Actors  | Identification   |
|---|--|
| Integrated Circuit (IC) Developer   | THALES DIS FRANCE SAS  |
| Embedded Software Developer (Also named OS developer for the phase 1 of the Life cycle) | Thales DIS (See [ALC-DVS] for details)   |
| Integrated Circuit (IC) Manufacturer  | THALES DIS FRANCE SAS  |
| Module Manufacturer   | THALES (when it is done before the TOE delivery)   |
| Form factor Manufacturer (optional)   | THALES (when it is done before the TOE delivery) It can be also an accredited company or the SC Issuer after the TOE delivery  |
| Card manufacturer (Initializer/Pre-personalizer)  | THALES (See [ALC-DVS] for details)   |
| Personalization Agent (Personalizer)  | The agent who is acting on the behalf of<br>the Issuer (e.g. issuing State or<br>Organization) and personalize the TOE<br>and applicative data (e.g. MRTD for the<br>holder) by activities establishing the<br>identity of the user (e.g. holder with<br>biographic data). |
| OS Update loader  | Agent who is acting on the behalf of the issuer to load the OS patch on the card   |
| Issuer  | The Issuer is the actual owner of the SE. As such, no OS Update operation shall be made without his consent. This concept has already been introduced in the SE PP.  |
| Card Holder   | The rightful holder of the card for whom the issuer personalizes it.   |

Table 2: Identification of the actors

## 2.5.1.2 Life cycle description

ST

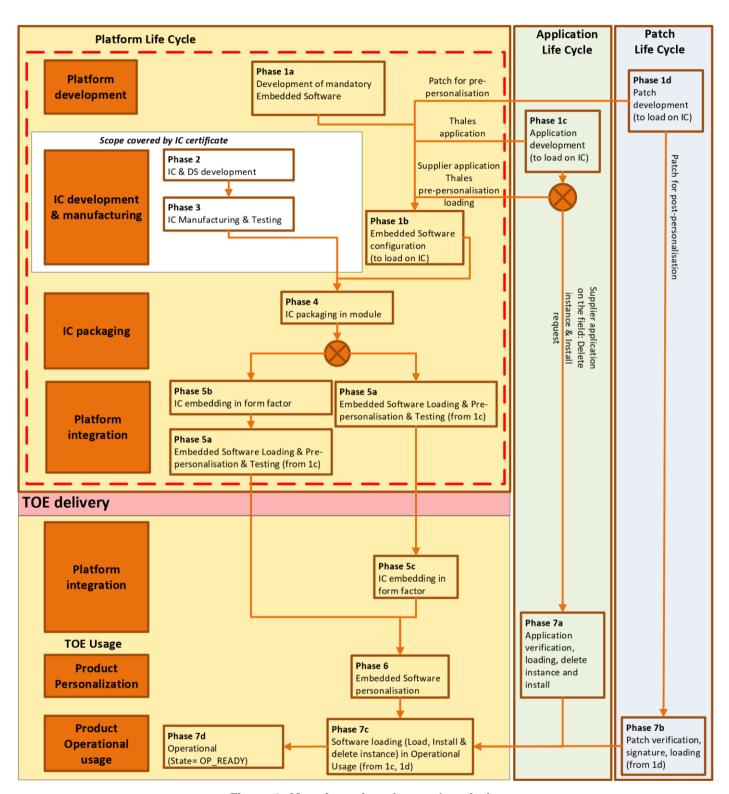

Figure 6: Manufacturing phases description

ST

# MultiApp V5.1: GP-SE Security Target

The Life cycle is described on the figure hereunder:

| Phase | e escribed on   | Description / comments  | Who   | Where   |
|-------|---|---|---|---|
|       |   |   |   | Thales  |
|       | MAV5.1 platform development   | Platform development & tests (1.a)  | Thales R&D team SL Crypto team - secure environment - | Development site<br>(see §2.5.4)              |
| 1     | Thales applets (IAS, eTravel) development                                   | - Applet Development (1.c) - Applet tests   | Thales R&D team - secure environment -                | Thales Development site (see §2.5.4)          |
|       | Patch development   | - Patch Development (1.d) - Patch tests   | Thales R&D team - secure environment -                | Thales Development site (see §2.5.4)          |
|       | PSE team  | - Platform configuration (1.b) - Script development   | Thales Product<br>Engineering                         | Thales manufacturing site (see §2.5.4)        |
| 2     | IC development  | Integrated circuits development   | THALES DIS France SAS -<br>Secure environment -       | THALES DIS France SAS development site(s)     |
| 3     | IC manufacturing & Testing  | Manufacturing of virgin integrated circuits embedding the THALES DIS France SAS flash loader, and protected by a dedicated transport key. | THALES DIS France SAS -<br>Secure environment -       | THALES DIS France SAS development site(s)     |
| 4     | SC manufacturing:<br>IC packaging &<br>Embedding, also<br>called "assembly" | - IC packaging & testing  | Thales Production teams - Secure environment -        | Thales manufacturing site (see §2.5.4)        |
| 5.a   | Initialization / Pre-personalization  | Loading of the Thales software (platform and applets on top based on script generated)  | Thales Production teams - Secure environment -        | Thales manufacturing site                     |
| 5.b   | Embedding   | Put the module on a dedicated form factor (Card, inlay MFF2, other)   |   | (see §2.5.4)                                  |
| 5c    | Embedding   | Put the module on a dedicated form factor (Card, inlay MFF2, other)   | SC Issuer or another accredited company               | SC Personalizer or<br>Accredited company site |
| 6     | SC Personalization  | Creation of files and loading of end-user data  | SC Issuer or Another accredited company               | SC Personalizer or<br>Accredited company site |
|       |   | Application verification before loading (7.a)   | SC Issuer   | Field   |
|       |   | Application Loading (Load, Install and delete instance capabilities) (7.c)  | SC Issuer   | Field   |
| 7     | End-usage   | Patch verification before loading (Signature) (7.b)   | Thales  | Field   |
|       |   | Patch update (7.b)  | Thales  | Field   |
|       |   | End-usage for cardholder (7.d)  | Cardholder  | Field   |

Figure 7: Life Cycle description

Remark 1: Initialization & pre-personalization operation could be done on module or on other form factor. The form factor does not affect the TOE security.

Remark 2: For initialization/pre-personalization IC flash loader could be used based on the IC manufacturer recommendation.

<u>Remark 3</u>: Embedding (module put on a dedicated form factor) will be done on an audited site if the *Embedding phase* (5a) is before the TOE delivery.

## 2.5.2 TOE Life-cycle

The Java Card System (the TOE) life cycle is part of the product life cycle, i.e. the Java Card platform with applications, which goes from product development to its usage by the final user.

The Java Card System (i.e. the TOE) life-cycle itself can be decomposed in four stages:

- Development
- Storage, pre-personalization and testing
- Personalization and testing
- Final usage

The JCS storage is not necessarily a single step in the life cycle since it can be stored in parts. The JCS delivery occurs before storage and may take place more than once if the TOE is delivered in parts. These four stages map to the product life cycle phases as shown in Figure 6.

As a summary description of how the parts of the TOE are delivered to the final customer, the MultiApp V5.1 application is delivered mainly in form of a smart card or inlay. The form factor is packaged on Thales DIS's manufacturing facility and sent to final customer premises.

The different guides accompanying the TOE and parts of the TOE are the ones specified in [AGD] section. They are delivered in form of electronic documents (\*.pdf) by Thales DIS's Technical representative.

#### Note related to patch development

ST

No patch is present within the TOE for the present evaluation. Indeed, should a patch be needed in the future, it would require at least a maintenance of the CC certificate, as required by the CC scheme rules. However, the patch mechanism is part of the TOE and as such its security is assessed within the present evaluation.

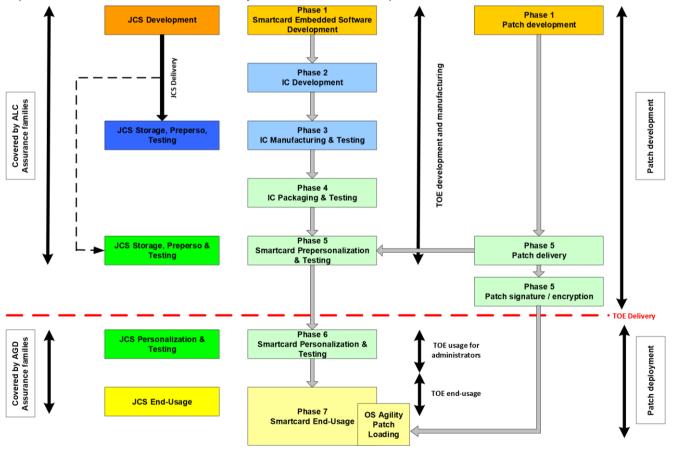

Figure 8: JCS (TOE) Life Cycle within Product Life Cycle

JCS Development is performed during Phase 1. This includes JCS conception, design, implementation, testing and documentation. The JCS development shall fulfill requirements of the final product, including conformance to Java Card Specifications, and recommendations of the SCP user guidance. The JCS development shall occur in a controlled environment that avoids disclosure of source code, data and any critical documentation and that guarantees the integrity of these elements. The present evaluation includes the JCS development environment.

In Phase 3, the IC Manufacturer may store, initialize the JCS and potentially conduct tests on behalf of the JCS developer. The IC Manufacturing environment shall protect the integrity and confidentiality of the JCS and of any related material, for instance test suites. The present evaluation includes the whole IC Manufacturing environment, in particular those locations where the JCS is accessible for installation or testing. As the Security IC has already been certified against [PP-IC-0084] there is no need to perform the evaluation again.

In Phase 5, the SC Pre-Personalizer may store, pre-personalize the JCS and potentially conduct tests on behalf of the JCS developer. The SC Pre-Personalization environment shall protect the integrity and confidentiality of the JCS and of any related material, for instance test suites.

(Part of) JCS storage in Phase 5 implies a TOE delivery after Phase 5. Hence, the present evaluation includes the SC Pre-Personalization environment. The TOE delivery point is placed at the end of Phase 5, since the entire TOE is then built and embedded in the Security IC.

The JCS is personalized in Phase 6, if necessary. The SC Personalization environment is not included in the present evaluation. Appropriate security recommendations are provided to the SC Personalizer through the [AGD] documentation.

The JCS final usage environment is that of the product where the JCS is embedded in. It covers a wide spectrum of situations that cannot be covered by evaluations. The JCS and the product shall provide the full set of security functionalities to avoid abuse of the product by untrusted entities.

Note: Potential applications loaded in pre-issuance will be verified using dedicated evaluated verification process. Applications loaded in post-issuance will need to follow dedicated development rules.

# 2.5.3 GP Life-cycle

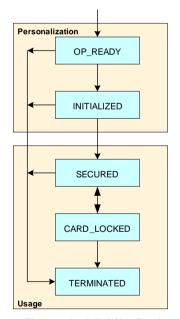

Figure 9: GP Life Cycle

Note that the Patch management (OS-Agility mechanisms) will be available only for the mode:

- OP READY
- INITIALIZED
- SECURED

#### 2.6 TOE INTENDED USAGE

## 2.6.1 Personalization Phase

During the Personalization Phase the following Administrative Services are available:

- Applet Load
- Applet Install
- Applet Personalization
- Applet Delete
- Applet Extradite
- Applet Management Lock

If the OS Agility is available:

Patch Management

All applet management operations require the authentication of the Issuer. By erasing the authentication keys with random numbers, the Issuer can prevent all subsequent applet management operations. This operation is not reversible. In the Personalization phase, Applet Management Lock is optional.

## 2.6.2 Usage Phase

During the Usage Phase, if the Applet Management lock has not been put, the Administrative Services are available as during the Personalization phase:

- Applet Load
- Applet Install
- Applet Personalization
- Applet Delete
- Applet Extradite
- Applet Management Lock

In addition, the following User services are available:

- Applet Selection
- Applet Interface

If the OS Agility is available

ST

Patch Management

## 2.6.2.1 NON-TOE HARDWARE/SOFTWARE/FIRMWARE REQUIRED BY THE TOE

In order to manage distant secure channel according to [GP23], a remote system must be able to establish a connection with TOE and therefore must possess shared secret with TOE.

Applets are supposed to be used with the platform to communicate to external world. Applet can create a dedicated secure channel using platform services. In such case, a remote system must be able to establish a connection with applet and therefore must possess shared secret with applet.

In order to manage local PACE secure channel, only local terminals possessing authorization information (a shared secret stored or retrieved by terminal (as PIN, CAN or MRZ) or secret derived from shared secret) can get access to the user data stored on the TOE and use security functionality.

<u>Application note</u>: Definition of local terminal is a refinement from the one in [PP\_EAC2] but without direct reference to travel document allowing usage of PACE secure channel for several purposes including travel document but not exclusively.

## 2.6.2.2 TOE Delivery

ST

As a summary description of how the parts of the TOE are delivered to the final customer, the MultiApp v5.1 embedded software is delivered mainly in form of a smart card, module or wafer. The form factor is packaged on Thales's manufacturing facility and sent to final customer premises.

The product is sent to the customer by standard transportation respecting Thales Transport Security Policies.

The different guides accompanying the TOE and parts of the TOE are the ones specified in [AGD] section. They are delivered in form of electronic documents (\*.pdf) by Thales's Technical representative via a secure file sharing platform download action.

| Item type                | Item  | Reference/Version                             | Form of delivery                             |

# 3 CONFORMANCE CLAIMS

#### 3.1 CC CONFORMANCE CLAIMS

#### **Common criteria Version:**

This ST conforms to CC Version 3.1 revision 5 [CC-1] [CC-2] [CC-3].

#### Conformance to CC part 2 and 3:

 CC part 2 extended with the FCS\_RNG, FMT\_LIM.1, FMT\_LIM.2 and FPT\_EMS.1 components. All the other security requirements have been drawn from the catalogue of requirements in Part 2 [CC-2]. - CC part 3 conformant.

The Common Methodology for Information Technology Security Evaluation, Evaluation Methodology; [CEM] has to be taken into account.

#### 3.2 PP CLAIM

The MultiApp V5.1 JCS security target claims the strict conformance to the Protection Profile "GlobalPlatform Technology Secure Element" ([PP-GP])

The MultiApp V5.1 JCS security target claims also the strict conformance to the Protection Profile "JavaCard System – Open configuration", ([PP-JCS-Open]).

The PP-GP extends the PP- JCS (see the [PP-GP] §3.3 Conformance Claim of the PP and §3.5 conformance Claim Rationale) with the packages:

- Package 'Cardholder Verification Method (CVM)' (section 10)
- Package 'Delegated Management (DM)' (section 11)
- Package 'DAP Verification' (section 12)
- Package 'Mandated DAP Verification' (section 13)
- PP-Module OS Update (section 18)

The MultiApp V5.1 JCS security target is a composite security target, including the IC security target [AQU-IC]. However, the security problem definition, the objectives, and the SFR of the IC are not described in this document.

## 3.3 [PP-GP] CONFORMANCE CLAIM RATIONAL WITH [PP-JCS-OPEN]

The relationship between the GP core SE PP and the Java Card PP is described hereafter. The relationship between assets, threats, OSPs, assumptions, security objectives and SFRs uses the following notation:

- Equivalent (E): The element in the GP core SE PP is the same as in [PP-JC-OPEN].
- Refinement (R): The element in the GP core SE PP refines the corresponding [PP-JC-OPEN] element.
   New names are given between brackets and added to the list of elements.
- Addition (A): The element is newly defined in the GP core SE PP; it is not present in [PP-JC-OPEN] and does not affect it.
- Not Included (NI): The element is defined in [PP-JC-OPEN] but not included in the [PP-GP].
- x: The element is present in [PP-JC-OPEN].

#### Conformity of the TOE Type

ST

The TOE type in the [PP-GP] extends the Java Card System defined in [PP-JC-OPEN].

## 3.3.1 SPD Consistency

## 3.3.1.1 Assets

All the assets defined in [PP-JC-OPEN] are relevant for the TOE of the core SE PP. The table below indicates the assets' consistency statement.

| Assets           | [PP-JC-OPEN] | [PP-GP]                                |
|------------------|--------------|--|
| D.API_DATA       | Х            | E                                      |
| D.CRYPTO         | Х            | E                                      |
| D.JCS_CODE       | Х            | E                                      |
| D.JCS_DATA       | Х            | E                                      |
| D.SEC_DATA       | Х            | E                                      |
| D.APP_CODE       | Х            | E                                      |
| D.APP_C_DATA     | Х            | E                                      |
| D.APP_I_DATA     | Х            | R                                      |
| D.APP_KEYS       | Х            | R                                      |
|                  |              | (D.ISD_KEYS, D.APSD_KEYS, D.CASD_KEYS) |
| D.PIN            | Х            | E                                      |
| D.ISD_KEYS       |              | Α                                      |
| D.APSD_KEYS      |              | Α                                      |
| D.CASD_KEYS      |              | Α                                      |
| D.TOE_IDENTIFIER |              | Α                                      |
| D.GP_REGISTRY    |              | Α                                      |
| D.GP_CODE        |              | Α                                      |

**Table 3: Assets consistency statement** 

The assets D.APSD\_KEYS, D.CASD\_KEYS and D.ISD\_KEYS are refinements of the asset D.APP\_KEYS in [PP-JCOPEN].

# 3.3.1.2 Users and Subjects

All the subjects defined in [PP-JC-OPEN] are relevant for the TOE of the core SE PP. The table below indicates the subjects' consistency statement.

| Subjects    | [PP-JC-OPEN] | [PP-GP]   |
|-------------|--------------|-----------|
| S.ADEL      | Х            | R: S.OPEN |
| S.APPLET    | Х            | Е         |
| S.BCV       | Х            | E         |
| S.CAD       | Х            | Е         |
| S.INSTALLER | Х            | R: S.OPEN |
| S.JCRE      | Х            | Е         |
| S.JCVM      | Х            | E         |
| S.LOCAL     | Х            | Е         |
| S.MEMBER    | Х            | Е         |
| S.PACKAGE   | Х            | Е         |
| S.SD        |              | Α         |
| S.OPEN      |              | Α         |

**Table 4: Subjects consistency statement** 

# 3.3.1.3 Threats

All the threats defined in [PP-JC-OPEN] are relevant for the TOE of the core SE PP. The table below contains the threats' consistency statement.

| Threats                  | [PP-JC-OPEN] | [PP-GP] |
|--------------------------|--------------|---------|
| T.CONFID-APPLI-DATA      | х            | E       |
| T.CONFID-JCS-CODE        | Х            | E       |
| T.CONFID-JCS-DATA        | х            | E       |
| T.INTEG-APPLI-CODE       | Х            | E       |
| T.INTEG-APPLI-CODE.LOAD  | х            | E       |
| T.INTEG-APPLI-DATA       | Х            | Е       |
| T.INTEG-APPLI-DATA.LOAD  | х            | E       |
| T.INTEG-JCS-CODE         | Х            | E       |
| T.INTEG-JCS-DATA         | х            | Е       |
| T.SID.1                  | Х            | E       |
| T.SID.2                  | х            | E       |
| T.EXE-CODE.1             | Х            | Е       |
| T.EXE-CODE.2             | х            | Ш       |
| T.NATIVE                 | Х            | Е       |
| T.RESOURCES              | х            | Ш       |
| T.DELETION               | Х            | Е       |
| T.INSTALL                | Х            | E       |
| T.OBJ-DELETION           | Х            | Е       |
| T.PHYSICAL               | х            | Ш       |
| T.COM_EXPLOIT            |              | Α       |
| T.UNAUTHORIZED_CARD_MNGT |              | Α       |
| T.LIFE_CYCLE             |              | Α       |
| T.BRUTE-FORCE-SCP        |              | Α       |

**Table 5: Threats consistency statement** 

- T.UNAUTHORIZED\_CARD\_MNGT refines T.INSTALL and T.DELETION from [PP-JC-OPEN].
- T.DELETION replaces A.DELETION from [PP-JC-OPEN].
- T.COM\_EXPLOIT is included to cover communication channels attacks.
- T.LIFE\_CYCLE is included to cover content management attacks.
- T.BRUTE-FORCE-SCP is included to cover brute force attacks.

# 3.3.1.4 Organizational Security Policy (OSP)

All the OSPs defined in [PP-JC-OPEN] are relevant for the TOE of the core SE PP. The table below provides the OSPs' consistency statement.

| OSPs                 | [PP-JC-OPEN] | [PP-GP] |
|----------------------|--------------|---------|
| OSP.VERIFICATION     | Х            | E       |
| OSP.AID-MANAGEMENT   |              | Α       |
| OSP.OTA-LOADING      |              | Α       |
| OSP.OTA-SERVERS      |              | Α       |
| OSP.APSD-KEYS        |              | Α       |
| OSP.KEY-GENERATION   |              | Α       |
| OSP.CASD-KEYS        |              | Α       |
| OSP.KEY-CHANGE       |              | А       |
| OSP.SECURITY-DOMAINS |              | Α       |
| OSP.ISSUER-KEYS      |              | Α       |
| OSP.APPLICATIONS     |              | Α       |

Table 6: OSP consistency statement

## 3.3.1.5 Assumptions

ST

All the assumptions defined in [PP-JC-OPEN] are relevant for the TOE in the [PP-GP] except A.DELETION that is replaced by O.DELETION.

The table below provides the assumptions' consistency statement.

| Assumptions              | [PP-JC-OPEN] | [PP-GP] |
|--------------------------|--------------|---------|
| A.APPLET                 | Х            | E       |
| A.VERIFICATION           | Х            | E       |
| A.OTA-ADMIN              |              | Α       |
| A.APPS-PROVIDER          |              | Α       |
| A.VERIFICATION-AUTHORITY |              | Α       |
| A.KEY-ESCROW             |              | Α       |
| A.PERSONALIZER           |              | Α       |
| A.CONTROLLING-AUTHORITY  |              | Α       |
| A.PRODUCTION             |              | Α       |
| A.ISSUER                 |              | Α       |
| A.SCP-SUPP               |              | Α       |
| A.KEYS-PROT              |              | Α       |

Table 7: OSP consistency statement

ST

# MultiApp V5.1: GP-SE Security Target

## 3.3.2 Security Objectives Consistency Statement

The entire set of objectives for the TOE and for the environment that are defined in [PP-JC-OPEN] are relevant for the TOE of the core SE PP.

# 3.3.2.1 Security Objectives for the TOE

The Table below provides consistency statement for the 'objectives for the TOE'.

| Objectives for the TOE  | [PP-JC-OPEN] | [PP-GP] |
|-------------------------|--------------|---------|
| O.SID                   | Х            | Е       |
| O.FIREWALL              | X            | E       |
| O.GLOBAL_ARRAYS_CONFID  | X            | E       |
| O.GLOBAL_ARRAYS_INTEG   | X            | E       |
| O.NATIVE                | X            | E       |
| O.OPERATE               | X            | E       |
| O.REALLOCATION          | X            | E       |
| O.RESOURCES             | X            | E       |
| O.ALARM                 | X            | E       |
| O.CIPHER                | X            | E       |
| O.RNG                   | X            | E       |
| O.KEY-MNGT              | X            | E       |
| O.PIN-MNGT              | X            | E       |
| O.TRANSACTION           | X            | E       |
| O.OBJ-DELETION          | X            | E       |
| O.DELETION              | X            | E       |
| O.LOAD                  | X            | E       |
| O.INSTALL               | X            | E       |
| O.CARD-MANAGEMENT       |              | Α       |
| O.DOMAIN_RIGHTS         |              | Α       |
| O.APPLI-AUTH            |              | Α       |
| O.COMM_AUTH             |              | A       |
| O.COMM_INTEGRITY        |              | Α       |
| O.COMM_CONFIDENTIALITY  |              | A       |
| O.SECURITY_DOMAINS      |              | А       |
| O.NO-KEY-REUSE          |              | А       |
| O.PRIVILEGES-MANAGEMENT |              | A       |
| O.LC-MANAGEMENT         |              | A       |

Table 8: Security Objectives for the TOE' consistency statement

# 3.3.2.2 Security Objectives for the environment

The Table below provides the consistency statement of the 'objectives for the operational environment'.

| Objectives for the environment | [PP-JC-OPEN] | [PP-GP]                       |
|--------------------------------|--------------|-------------------------------|
| OE.APPLET                      | Х            | E                             |
| OE.CARD-MANAGEMENT             | X            | Replaced by O.CARD-MANAGEMENT |
| OE.SCP.IC                      | Х            | E                             |
| OE.SCP.RECOVERY                | Х            | E                             |
| OE.SCP.SUPPORT                 | Х            | E                             |

Table 9: Security Objectives for the Operational Environment' consistency statement

OE.CARD\_MANAGEMENT defined in [PP-JC-OPEN] becomes an objective for the TOE in the core SE PP.

ST

## 3.3.3 SFRs and SARs Consistency Statements

## 3.3.3.1 Consistency of Policies

All the security policies of [PP-JC-OPEN] are relevant to the TOE of the [PP-GP] as shown in the Table below.

| [PP-JC-OPEN]                                 | [PP-GP]   | Changes   |
|--|---|---|
| Package Loading information flow control SFP | ELF Loading information flow control SFP        | The term "Package" is replaced by "ELF" as stated in [GP23]                                   |
|  | Data & Key Loading information flow control SFP | Addition for loading of SD/Application keys and data through STORE DATA and PUT KEY commands. |

Table 10: Policies' statement consistency

## 3.3.3.2 Consistency of SFRs

All the mandatory SFRs of [PP-JC-OPEN] are relevant to the TOE of the [PP-GP]as shown in the Table below. All the operations performed on the Java Card SFRs are appropriate for the TOE, which includes the full Java Card System.

| SFRs                    | [PP-JC-OPEN] | [PP-GP] |
|-------------------------|--------------|---------|
| FDP_ACC.2/FIREWALL      | X            | E       |

Table 11: SFRs' consistency statement

# 3.3.3.3 SARs' Consistency

The [PP-GP] claims the same evaluation assurance level as [PP-JC-OPEN], that is EAL4 augmented with ALC\_DVS.2 and AVA\_VAN.5.

# 3.4 PACKAGE CLAIM

This ST is conforming to assurance package EAL6+ augmented with ALC\_FLR.2 defined in CC part 3 [CC-3].

## 3.5 CONFORMANCE STATEMENT

This ST strictly conforms to [PP-JCS-Open]. The conformance is explained in the rationale. Items relative to PACE module from [PP\_EAC2] have been added to perform composite evaluation but no conformance to [PP\_EAC2] is required.

# 4 **SECURITY ASPECTS**

This chapter describes the main security issues of the Java Card System and its environment addressed in this ST, called "security aspects", in a CC-independent way. In addition to this, they also give a semi-formal framework to express the CC security environment and objectives of the TOE. They can be instantiated as assumptions, threats, objectives (for the TOE and the environment) or organizational security policies. For instance, we will define hereafter the following aspect:

#.OPERATE (1) The TOE must ensure continued correct operation of its security functions.

(2) The TOE must also return to a well-defined valid state before a service request in case of failure during its operation.

TSFs must be continuously active in one way or another; this is called "OPERATE".

#### 4.1 CONFIDENTIALITY

#.CONFID-APPLI-DATA Application data must be protected against unauthorized disclosure. This concerns logical attacks at runtime in order to gain read access to other application's data.

#.CONFID-JCS-CODE Java Card System code must be protected against unauthorized disclosure.

Knowledge of the Java Card System code may allow bypassing the TSF. This concerns logical attacks at runtime in order to gain a read access to executable code, typically by executing an application that tries to read the

memory area where a piece of Java Card System code is stored.

#.CONFID-JCS-DATA Java Card System data must be protected against unauthorized disclosure.

This concerns logical attacks at runtime in order to gain a read access to Java Card System data. Java Card System data includes the data managed by the Java Card RE, the Java Card VM and the internal data of Java Card

platform API classes as well.

#### 4.2 INTEGRITY

#.INTEG-APPLI-CODE Application code must be protected against unauthorized modification. This

concerns logical attacks at runtime in order to gain write access to the memory zone where executable code is stored. In post-issuance application loading, this threat also concerns the modification of application code in

transit to the card.

#.INTEG-APPLI-DATA Application data must be protected against unauthorized modification. This

concerns logical attacks at runtime in order to gain unauthorized write access to application data. In post-issuance application loading, this threat also concerns the modification of application data contained in a CAP file in transit to the card. For instance, a CAP file contains the values to be used

for initializing the static fields of the CAP file.

#.INTEG-JCS-CODE Java Card System code must be protected against unauthorized

modification. This concerns logical attacks at runtime in order to gain write

access to executable code.

#.INTEG-JCS-DATA Java Card System data must be protected against unauthorized

modification. This concerns logical attacks at runtime in order to gain write access to Java Card System data. Java Card System data includes the data managed by the Java Card RE, the Java Card VM and the internal data of

Java Card API classes as well.

ST

#### 4.3 UNAUTHORIZED EXECUTIONS

#.EXE-APPLI-CODE Application (byte) code must be protected against unauthorized execution. This

concerns (1) invoking a method outside the scope of the accessibility rules provided by the access modifiers of the Java programming language ([JAVASPEC]§6.6); (2) jumping inside a method fragment or interpreting the contents of a data memory area as

if it was executable code.;

#.EXE-JCS-CODE Java Card System bytecode must be protected against unauthorized

execution. Java

Card System bytecode includes any code of the Java Card RE or API. This concerns (1) invoking a method outside the scope of the accessibility rules provided by the access modifiers of the Java programming language ([JAVASPEC]§6.6); (2) jumping inside a method fragment or interpreting the contents of a data memory area as if it was executable code. Note that execute access to native code of the Java Card System and applications is the concern

of #.NATIVE.

#.FIREWALL The Firewall shall ensure controlled sharing of class instances, and isolation

of their data and code between CAP files (that is, controlled execution contexts) as well as between CAP files and the JCRE context. An applet shall neither read, write nor compare a piece of data belonging to an applet that is not in the same context, nor execute one of the methods of an applet in another

context without its authorization.

#.NATIVE Because the execution of native code is outside of the JCS TSF scope, it must

be secured so as to not provide ways to bypass the TSFs of the JCS. Loading of native code, which is as well outside the TSFs, is submitted to the same requirements. Should native software be privileged in this respect, exceptions to the policies must include a rationale for the new security framework they

introduce.

## 4.4 BYTECODE VERIFICATION

#.VERIFICATION All bytecode must be verified prior to being executed. Bytecode verification includes (1)

how well-formed CAP file is and the verification of the typing constraints on the bytecode, (2) binary compatibility with installed CAP files and the assurance that the export files used to check the CAP file correspond to those that will be present on

the card when loading occurs.

## 4.4.1 CAP file Verification

ST

Bytecode verification includes checking at least the following properties: (1) bytecode instructions represent a legal set of instructions used on the Java Card platform; (2) adequacy of bytecode operands to bytecode semantics; (3) absence of operand stack overflow/underflow; (4) control flow confinement to the current method (that is, no control jumps to outside the method); (5) absence of illegal data conversion and reference forging; (6) enforcement of the private/public access modifiers for class and class members; (7) validity of any kind of reference used in the bytecodes (that is, any pointer to a bytecode, class, method, object, local variable, etc actually points to the beginning of piece of data of the expected kind); (8) enforcement of rules for binary compatibility (full details are given in [JCVM3], [JVM], [JCBV]). The actual set of checks performed by the verifier is implementation-dependent, but shall at least enforce all the "must clauses" imposed in [JCVM3] on the bytecodes and the correctness of the CAP files' format.

As most of the actual Java Card VMs do not perform all the required checks at runtime, mainly because smart cards lack memory and CPU resources, CAP file verification prior to execution is mandatory. On the other hand, there is no requirement on the precise moment when the verification shall actually take place, as far as it can be ensured that the verified file is not modified thereafter. Therefore, the bytecodes can be verified either before the loading of the file on to the card or before the installation of the file in the card or before the execution, depending on the card capabilities, in

order to ensure that each bytecode is valid at execution time. This Security Target assumes bytecode verification is performed off-card.

Another important aspect to be considered about bytecode verification and application downloading is, first, the assurance that every CAP file required by the loaded applet is indeed on the card, in a binary-compatible version (binary compatibility is explained in [JCVM3] §4.4), second, that the export files used to check and link the loaded applet have the corresponding correct counterpart on the card.

# 4.4.2 Integrity and Authentication

Verification off-card is useless if the application CAP files is modified afterwards. The usage of cryptographic certifications coupled with the verifier in a secure module is a simple means to prevent any attempt of modification between CAP file verification and CAP file installation.

Once a verification authority has verified the CAP file, it signs it and sends it to the card. Prior to the installation of the CAP file, the card verifies the signature of the CAP file, which authenticates the fact that it has been successfully verified. In addition to this, a secured communication channel is used to communicate it to the card, ensuring that no modification has been performed on it.

Alternatively, the card itself may include a verifier and perform the checks prior to the effective installation of the applet or provide means for the bytecodes to be verified dynamically. On-card bytecode verifier is out of the scope of this Security Target.

# 4.4.3 Linking and Verification

Beyond functional issues, the installer ensures at least a property that matters for security: the loading order shall guarantee that each newly loaded CAP file references only CAP files that have been already loaded on the card. The linker can ensure this property because the Java Card platform does not support dynamic downloading of classes.

#### 4.5 CARD MANAGEMENT

- #.CARD-MANAGEMENT (1) The card manager (CM) shall control the access to card management functions such as the installation, update or deletion of applets. (2) The card manager shall implement the card issuer's policy on the card.
- #.INSTALL (1) The TOE must be able to return to a safe and consistent state should the installation of a CAP file or an applet fail or be cancelled (whatever the reasons). (2) Installing an applet must have no effect on the code and data of already installed applets. The installation procedure should not be used to bypass the TSFs. In short, it is an atomic operation, free of harmful effects on the state of the other applets. (3) The procedure of loading and installing a CAP file shall ensure its integrity and authenticity. In case of Extended CAP files, installation of a CAP shall ensure installation of all the packages in the CAP file.
- #.SID (1) Users and subjects of the TOE must be identified. (2) The identity of sensitive users and subjects associated with administrative and privileged roles must be particularly protected; this concerns the Java Card RE, the applets registered on the card, and especially the default applet and the currently selected applet (and all other active applets in Java Card System 2.2). A change of identity, especially standing for an administrative role (like an applet impersonating the Java Card RE), is a severe violation of the Security Functional Requirements (SFR).
  Selection controls the access to any data exchange between the TOE and the CAD and therefore, must be protected as well. The loading of a CAP file or any exchange of data through the APDU buffer (which can be accessed by any applet)

can lead to disclosure of keys, application code or data, and so on.

Ref: D1569436\_LITE Rev: 1.25

ST

#.OBJ-DELETION (1) Deallocation of objects should not introduce security holes in the form of references pointing to memory zones that are not longer in use, or have been reused for other purposes. Deletion of collection of objects should not be maliciously used to circumvent the TSFs. (2) Erasure, if deemed successful, shall ensure that the deleted class instance is no longer accessible.

#.DELETION

(1) Deletion of installed applets (or CAP files) should not introduce security holes in the form of broken references to garbage collected code or data, nor should they alter integrity or confidentiality of remaining applets. The deletion procedure should not be maliciously used to bypass the TSFs. (2) Erasure, if deemed successful, shall ensure that any data owned by the deleted applet is no longer accessible (shared objects shall either prevent deletion or be made inaccessible). A deleted applet cannot be selected or receive APDU commands. CAP file deletion shall make the code of the CAP file no longer available for execution. In case of Extended CAP files, deletion of a CAP shall ensure that code and data for all the packages in the CAP file is no longer available for execution. (3) Power failure or other failures during the process shall be taken into account in the implementation so as to preserve the SFRs. This does not mandate, however, the process to be atomic. For instance, an interrupted deletion may result in the loss of user data, as long as it does not violate the SFRs.

The deletion procedure and its characteristics (whether deletion is either physical or logical, what happens if the deleted application was the default applet, the order to be observed on the deletion steps) are implementation dependent. The only commitment is that deletion shall not jeopardize the TOE (or its assets) in case of failure (such as power shortage).

Deletion of a single applet instance and deletion of a whole CAP file are functionally different operations and may obey different security rules. For instance, specific CAP files can be declared to be undeletable (for instance, the Java Card API CAP files), or the dependency between installed CAP files may forbid the deletion (like a CAP file using super classes or super interfaces declared in another CAP file).

#### 4.6 SERVICES

#.ALARM

The TOE shall provide appropriate feedback upon detection of a potential security violation. This particularly concerns the type errors detected by the bytecode verifier, the security exceptions thrown by the Java Card VM, or any other security-related event occurring during the execution of a

#.OPERATE

(1) The TOE must ensure continued correct operation of its security functions. (2) In case of failure during its operation, the TOE must also return to a well-defined valid state before the next service request.

#.RESOURCES

The TOE controls the availability of resources for the applications and enforces quotas and limitations in order to prevent unauthorized denial of service or malfunction of the TSFs. This concerns both execution (dynamic memory allocation) and installation (static memory allocation) of applications and CAP files.

#.CIPHER

The TOE shall provide a means to the applications for ciphering sensitive data, for instance, through a programming interface to low-level, highly secure cryptographic services. In particular, those services must support cryptographic algorithms consistent with cryptographic usage policies and standards.

#.KEY-MNGT

The TOE shall provide a means to securely manage cryptographic keys. This includes: (1) Keys shall be generated in accordance with specified cryptographic key generation algorithms and specified cryptographic key sizes, (2) Keys must be distributed in accordance with specified cryptographic key distribution methods, (3) Keys must be initialized before being used, (4) Keys shall be destroyed in accordance with specified cryptographic key destruction methods.

#.PIN-MNGT

The TOE shall provide a means to securely manage PIN objects. This includes: (1) Atomic update of PIN value and try counter, (2) No rollback on the PINchecking function, (3) Keeping the PIN value (once initialized) secret (for instance, no clear-PIN-reading function), (4) Enhanced protection of PIN's security attributes (state, try counter...) in confidentiality and integrity.

#.SCP

The smart card platform must be secure with respect to the SFRs. Then: (1) After a power loss, RF signal loss or sudden card removal prior to completion of some communication protocol, the SCP will allow the TOE on the next power up to either complete the interrupted operation or revert to a secure state. (2) It does not allow the SFRs to be bypassed or altered and does not allow access to other low-level functions than those made available by the CAP files of the Java Card API. That includes the protection of its private data and code (against disclosure or modification) from the Java Card System. (3) It provides secure low-level cryptographic processing to the Java Card System. (4) It supports the needs for any update to a single persistent object or class field to be atomic, and possibly a low-level transaction mechanism. (5) It allows the Java Card System to store data in "persistent technology memory" or in volatile memory, depending on its needs (for instance, transient objects must not be stored in non-volatile memory). The memory model is structured and allows for low-level control accesses (segmentation fault detection). (6) It safely transmits low-level exceptions to the TOE (arithmetic exceptions, checksum errors), when applicable. Finally, it is required that (7) the IC is designed in accordance with a well defined set of policies and standards (for instance, those specified in [PP-IC-0035]), and will be tamper resistant to actually prevent an attacker from extracting or altering security data (like cryptographic keys) by using commonly employed techniques (physical probing and sophisticated analysis of the chip). This especially matters to the management (storage and operation) of cryptographic keys.

#.TRANSACTION

The TOE must provide a means to execute a set of operations atomically. This mechanism must not jeopardise the execution of the user applications. The transaction status at the beginning of an applet session must be closed (no pending updates).

# 5 SECURITY PROBLEM DEFINITION

#### 5.1 Assets

The assets of the TOE are those defined in [PP-JCS-Open]. The assets of [PP-IC-0084] are studied in [AQU-IC].

Assets are security-relevant elements to be directly protected by the TOE. Confidentiality of assets is always intended with respect to un-trusted people or software, as various parties are involved during the first stages of the smart card product life-cycle; details are given in threats hereafter.

Assets may overlap, in the sense that distinct assets may refer (partially or wholly) to the same piece of information or data. For example, a piece of software may be either a piece of source code (one asset) or a piece of compiled code (another asset), and may exist in various formats at different stages of its development (digital supports, printed paper). This separation is motivated by the fact that a threat may concern one form at one stage, but be meaningless for another form at another stage.

The assets to be protected by the TOE are listed below. They are grouped according to whether it is data created by and for the user (User data) or data created by and for the TOE (TSF data). For each asset it is specified the kind of dangers that weigh on it.

#### 5.1.1 User data

# 5.1.1.1 JCS User data Assets

#### **D.APP CODE**

The code of the applets and libraries loaded on the card. To be protected from unauthorized modification.

#### D.APP C DATA

Confidential sensitive data of the applications, like the data contained in an object, a static field, a local variable of the currently executed method, or a position of the operand stack. To be protected from unauthorized disclosure.

#### D.APP I DATA

Integrity sensitive data of the applications, like the data contained in an object and the PIN security attributes (PIN Try limit, PIN Try counter and State). To be protected from unauthorized modification.

#### **D.APP KEYs**

Cryptographic keys owned by the applets.

To be protected from unauthorized disclosure and modification.

#### D.PIN

Any end-user's PIN.

To be protected from unauthorized disclosure and modification.

#### 5.1.1.2 GP User Data Assets

#### **D.ISD KEYS**

ISD cryptographic keys needed to perform card management operations on the card. To be protected from unauthorised disclosure and modification. (Refinement of D.APP\_KEYS)

## D.APSD KEYS

APSD cryptographic keys needed to establish Secure Channels with the AP. These keys can be used to load and install applications on the card if the Security Domain has the appropriate privileges.

To be protected from unauthorised disclosure and modification. (Refinement of D.APP\_KEYS)

## D.CASD\_KEYS

ST

CASD cryptographic keys needed to establish Secure Channels with the CA and to decrypt confidential content for APSDs

To be protected from unauthorised disclosure and modification. (Refinement of D.APP\_KEYS)

#### 5.1.2 TSF data

#### 5.1.2.1 JCS TSF data Assets

#### D.API DATA

Private data of the API, like the contents of its private fields.

To be protected from unauthorized disclosure and modification.

#### **D.CRYPTO**

Cryptographic data used in runtime cryptographic computations, like a seed used to generate a key. To be protected from unauthorized disclosure and modification.

#### D.JCS\_CODE

The code of the Java Card System.

To be protected from unauthorized disclosure and modification.

#### **D.JCS DATA**

The internal runtime data areas necessary for the execution of the Java Card VM, such as, for instance, the frame stack, the program counter, the class of an object, the length allocated for an array, any pointer used to chain datastructures.

To be protected from monopolization and unauthorized disclosure or modification.

#### D.SEC DATA

The runtime security data of the Java Card RE, like, for instance, the AIDs used to identify the installed applets, the currently selected applet, the current context of execution and the owner of each object. To be protected from unauthorized disclosure and modification.

## 5.1.2.2 GP TSF data Assets

#### **D.GP REGISTRY**

The information resource for Card Content management. The GlobalPlatform Registry contains information for managing the card, as well as Executable Load Files, Applications, SD associations, privileges, Identifiers, life cycle states, and memory resource quotas.

To be protected from unauthorised modification.

#### D.GP CODE

The code of the GlobalPlatform Framework on the card. To be protected from unauthorised modification.

# D.TOE\_IDENTIFIER

TOE Identification Data to identify the TOE.

ST

# 5.1.3 Supplementary assets

# 5.1.3.1 Package 'Cardholder Verification Method (CVM)'

#### D.CVM PIN

A single global PIN used to authenticate the Cardholder, which can be shared by all the application instances in the card.

To be protected from unauthorised modification and disclosure.

#### D.CVM\_MGMT\_STATE

The CVM management data include:

- CVM value and state (e.g. to determine if the CVM value has been submitted, verified, or blocked)
- CVM Retry Limit: The maximum number of presentations of invalid CVM values, until the CVM handler rejects further presentation attempts.
- CVM Retry Counter: A counter, used in conjunction with the Retry Limit, to determine when attempts for presenting CVM values shall be rejected.

To be protected from unauthorised modification.

# 5.1.3.2 Package 'Delegated Management (DM)'

#### **D.TOKEN-VERIFICATION-KEY**

The symmetric key or the public asymmetric key to be used for token verification. To be protected from unauthorised modification and disclosure.

#### **D.RECEIPT-GENERATION-KEY**

The symmetric key or the private asymmetric key to be used for receipt generation. To be protected from unauthorised modification and disclosure.

#### **D.CONFIRMATION-DATA**

The confirmation Data generated by an SD with the Receipt Generation Privilege. To be protected from unauthorised modification.

Application Note: See [GP23] section 11.1.6.

# 5.1.3.3 Package 'DAP Verification'

## D.DAP\_BLOCK

Authentication data present in the Load File and generated by an off-card entity (an Application Provider or a Verification Authority). The authentication data contains the SD AID and the Load File Data Block Signature of the Load File Data Block Hash.

To be protected from unauthorised modification.

#### D.APSD DAP KEYS

Refinement of D.APP\_KEYS of [PP-JC]. The APSD cryptographic keys are required for verification of the Load File Block signatures.

To be protected from unauthorised disclosure and modification

## 5.1.3.4 Package 'Mandated DAP Verification'

## D.CASD DAP KEYS

ST

Refinement of D.APP\_KEYS of [PP-JC]. The CASD cryptographic keys are required for verification of the Load File Data Block signatures.

To be protected from unauthorised disclosure and modification.

# 5.1.3.5 Package PP-Module OS Update

The following assets are related to patch management in post-issuance phase (phase 7). As mentioned in section 2.5.2, there is no patch associated to the present TOE, however the patch mechanisms are within the evaluation scope.

| D.OS-UPDATE_DEC-KEY            | Refinement of D.APP_KEYS. A cryptographic key, owned by the OS Developer, and used by the TOE to decrypt the additional code to be loaded. Note: No assumption is made on the type of this decryption key, i.e. it can be either a symmetric key or the secret component of an asymmetric key pair. To be protected from unauthorised disclosure and modification.  |
|--------------------------------|---|
| D.OS-UPDATE_SGNVER-KEY         | Refinement of D.APP_KEYS. A cryptographic key, owned by the OS Developer, and used by the TOE to verify the signature of the additional code to be loaded.  |
|                                | Note: No assumption is made on the type of this signature verification key, i.e. it can be either a symmetric key or the public component of an asymmetric key pair.  In case of a symmetric key: to be protected from unauthorised disclosure and modification.  In case of an asymmetric public key: to be protected from unauthorised modification.  |
| D.OS-<br>UPDATE_ADDITIONALCODE | The code to be added to the OS after TOE issuance. The additional code has to be signed by the OS Developer. After successful verification of the signature by the Initial TOE, the additional code is loaded and installed through an atomic activation (to create an Updated TOE).  To be protected from unauthorised disclosure and modification.  |
| D.OS-UPDATE-CODE-ID            | The identification data associated with the additional code. It is loaded and/or updated in the same atomic operation as additional code loading.  To be protected from unauthorised modification.  |
|                                | Application Note: The identification data (D.OS-UPDATE-CODE-ID) may also be protected from unauthorised disclosure (confidentiality requirement) by not permitting an attacker to determine whether a given TOE has been updated or not (even if it is not possible to distinguish between functional and security updates). However, confidentiality is not mandatory since in most cases the identification data must be readily available on the field through technical commands, even in the TERMINATED state. |

ST

# 5.2 ITEMS FOR PACE MODULE

<u>Application note</u>: Definition of asset associated to PACE module is a refinement from the one in [PP\_EAC2] but without direct reference to travel document allowing usage of PACE secure channel for several purposes including travel document but not exclusively.

# 5.2.1 Primary assets or user data

| Object<br>No. | Asset  | Definition   | Generic security property to be maintained by the current security policy |
|---------------|--|--|---|
| 1             | user data stored on the TOE (requiring PACE secure channel)  | All data (being not authentication data) being allowed to be read out solely by an authenticated terminal acting as Basic Inspection System with PACE (in the sense of [ICAO-TR-SAC]).   | Confidentiality<br>Integrity<br>Authenticity                              |
| 2             | user data transferred<br>between the TOE and the<br>terminal connected (i.e. an<br>authority represented by<br>Basic Inspection System with<br>PACE) | All data (being not authentication data) being transferred between the TOE and an authenticated terminal acting as Basic Inspection System with PACE (in the sense of [ICAO-TR-SAC]).  User data can be received and sent (exchange \$\times\$ {receive, send}). | Confidentiality<br>Integrity<br>Authenticity                              |

**Table 12: Primary Assets** 

Note: Unavailability in a sense of non-disclosure of data allowing user traceability.

# 5.2.2 Secondary assets and TSF data

The secondary assets also having to be protected by the TOE in order to achieve a sufficient protection of the primary assets are listed in the following table. The secondary assets represent TSF and TSF-data in the sense of the CC.

| Object<br>No. | Asset  | Definition   | Generic security property to be maintained by the current security policy |
|---------------|--|--|---|
| 4             | Accessibility to the TOE functions and data only for authorised subjects | Property of the TOE to restrict access to TSF and TSF-data stored in the TOE to authorised subjects only.  | Availability  |
| 5             | PACE establishment authorization data                                    | Restricted-revealable authorization information for a human user being used for verification of the authorization attempts as authorized user (PACE password). These data are stored in the TOE and are not to be send to it.      | Confidentiality Integrity   |
| 6             | TOE internal secret cryptographic keys                                   | Permanently or temporarily stored secret cryptographic material used by the TOE in order to enforce its security functionality.  | Confidentiality Integrity   |
| 7             | TOE internal nonsecret cryptographic material                            | Permanently or temporarily stored non-secret cryptographic (public) keys and other non-secret material (Document Security Object SOD containing digital signature) used by the TOE in order to enforce its security functionality. | Integrity Authenticity  |

**Table 13: Secondary Assets** 

Note: PACE passwords are not to be sent to the TOE.

# 5.2.3 Subjects and external entities

The ST considers the following external entities and subjects for PACE usage:

| External Entity No. | Role   | Definition  |
|---------------------|--|---|
| 1                   | Application user (e.g. travel document holder).                  | This entity is commensurate with application user for whom the Issuer has personalised the PACE part of the TOE and therefore may use PACE secure channel (e.g. 'MRTD Holder' in [PP-BAC])  |
| 2                   | Application user (e.g. travel document presenter)                | This entity is commensurate with application user with usage of PACE secure channel to be authenticated (e.g. 'Traveller' in [PP-BAC])  |
| 3                   | Terminal   | A terminal is any technical system communicating with the TOE through the contactless/contact interface and being recognised by the TOE as not being PACE authenticated. This entity is commensurate with 'Terminal' in [PP-BAC]. |
| 4                   | PACE Terminal (e.g. Basic Inspection System with PACE (BIS-PACE) | A local system communicating with the TOE and implementing the terminal's part of the PACE protocol.  This entity is commensurate with BIS-PACE in [PP-PACE].   |
| 5                   | Personalisation Agent  | This entity is commensurate with 'Personalisation agent' in [PPBAC].  |
| 6                   | Manufacturer   | This entity is commensurate with 'IC Manufacturer' and FF Manufacturer and Prepersonalizer roles as defined in §2.5.1.2 Life cycle description.   |
| 7                   | Attacker   | This external entity is commensurate with 'Attacker' in [PPBAC].  |

Table 14: Subjects and External Entities

# 5.3 THREATS FROM JAVACARDD SYSTEM PROTECTION PROFILE - OPEN CONFIGURATION

This section introduces the threats to the assets against which specific protection within the TOE or its environment is required. The threats are classified in several groups.

## 5.3.1 Confidentiality

## T.CONFID-APPLI-DATA

The attacker executes an application to disclose data belonging to another application. See #.CONFID-APPLIDATA for details.

Directly threatened asset(s): **D.APP\_C\_DATA**, **D.PIN**, and **D.APP\_KEYs**.

#### T.CONFID-JCS-CODE

The attacker executes an application to disclose the Java Card System code. See #.CONFID-JCS-CODE for details.

Directly threatened asset(s): **D.JCS\_CODE**.

#### T.CONFID-JCS-DATA

The attacker executes an application to disclose data belonging to the Java Card System. See #.CONFID-JCSDATA for details.

Directly threatened asset(s): D.API\_DATA, D.SEC\_DATA, D.JCS\_DATA, and D.CRYPTO.

#### 5.3.2 Integrity

ST

# T.INTEG-APPLI-CODE

The attacker executes an application to alter (part of) its own code or another application's code. See #.INTEGAPPLI-CODE for details.

Directly threatened asset(s): D.APP\_CODE

#### T.INTEG-APPLI-CODE.LOAD

The attacker modifies (part of) its own or another application code when an application CAP file is transmitted to the card for installation. See #.INTEG-APPLI-CODE for details. Directly threatened asset(s): **D.APP CODE**.

#### T.INTEG-APPLI-DATA

The attacker executes an application to alter (part of) another application's data. See #.INTEG-APPLI-DATA for details.

Directly threatened asset(s): D.APP I DATA, D.PIN, and D.APP KEYs.

#### T.INTEG-APPLI-DATA.LOAD

The attacker modifies (part of) the initialization data contained in an application CAP file when the CAP file is transmitted to the card for installation. See #.INTEG-APPLI-DATA for details. Directly threatened asset(s): **D.APP I DATA** and **D APP\_KEYs**.

#### T.INTEG-JCS-CODE

The attacker executes an application to alter (part of) the Java Card System code. See #.INTEG-JCS-CODE for details.

Directly threatened asset(s): D.JCS CODE.

#### T.INTEG-JCS-DATA

The attacker executes an application to alter (part of) Java Card System or API data. See #.INTEG-JCS-DATA for details.

Directly threatened asset(s): D.API\_DATA, D.SEC\_DATA, D.JCS\_DATA, and D.CRYPTO.

Other attacks are in general related to one of the above, and aimed at disclosing or modifying on-card information. Nevertheless, they vary greatly on the employed means and threatened assets, and are thus covered by quite different objectives in the sequel. That is why a more detailed list is given hereafter.

# 5.3.3 Identity usurpation

#### T.SID.1

An applet impersonates another application, or even the Java Card RE, in order to gain illegal access to some resources of the card or with respect to the end user or the terminal. See #.SID for details.

Directly threatened asset(s): D.SEC\_DATA (other assets may be jeopardized should this attack succeed, for instance, if the identity of the JCRE is usurped), D.PIN and D.APP KEYs.

#### T.SID.2

The attacker modifies the TOE's attribution of a privileged role (e.g. default applet and currently selected applet), which allows illegal impersonation of this role. See #.SID for further details.

Directly threatened asset(s): D.SEC\_DATA (any other asset may be jeopardized should this attack succeed, depending on whose identity was forged).

#### 5.3.4 Unauthorized execution

## T.EXE-CODE.1

An applet performs an unauthorized execution of a method. See #.EXE-JCS-CODE and #.EXE-APPLI-CODE for details.

Directly threatened asset(s): **D.APP CODE**.

#### T.EXE-CODE.2

An applet performs an execution of a method fragment or arbitrary data. See #.EXE-JCS-CODE and #.EXE-APPLICODE for details.

Directly threatened asset(s): D.APP CODE.

#### **T.NATIVE**

ST

An applet executes a native method to bypass a security function such as the firewall. See #.NATIVE for details. Directly threatened asset(s): **D.JCS DATA**.

#### 5.3.5 Denial of Service

#### **T.RESOURCES**

An attacker prevents correct operation of the Java Card System through consumption of some resources of the card: RAM or NVRAM. See #.RESOURCES for details. Directly threatened asset(s): **D.JCS\_DATA**.

# 5.3.6 Card management

#### **T.DELETION**

The attacker deletes an applet or a CAP file already in use on the card, or uses the deletion functions to pave the way for further attacks (putting the TOE in an insecure state). See #.DELETION for details). Directly threatened asset(s): **D.SEC\_DATA** and **D.APP\_CODE**.

#### T.INSTALL

The attacker fraudulently installs post-issuance of an applet on the card. This concerns either the installation of an unverified applet or an attempt to induce a malfunction in the TOE through the installation process. See #.INSTALL for details

Directly threatened asset(s): **D.SEC\_DATA** (any other asset may be jeopardized should this attack succeed, depending on the virulence of the installed application).

#### 5.3.7 Services

#### **T.OBJ-DELETION**

The attacker keeps a reference to a garbage collected object in order to force the TOE to execute an unavailable method, to make it to crash, or to gain access to a memory containing data that is now being used by another application. See #.OBJ-DELETION for further details.

Directly threatened asset(s): D.APP\_C\_DATA, D.APP\_I\_DATA and D.APP\_KEYs.

#### 5.3.8 Miscellaneous

#### T.PHYSICAL

ST

The attacker discloses or modifies the design of the TOE, its sensitive data or application code by physical (opposed to logical) tampering means. This threat includes IC failure analysis, electrical probing, unexpected tearing, and DPA. That also includes the modification of the runtime execution of Java Card System or SCP software through alteration of the intended execution order of (set of) instructions through physical tampering techniques.

This threatens all the identified assets.

This threat refers to the point (7) of the security aspect #.SCP, and all aspects related to confidentiality and integrity of code and data.

# 5.4 THREATS ASSOCIATED TO PACE MODULE

Application note: Threats in this paragraph are refined form [PP\_EAC2] in a more generic form in order to be applicable to any application requiring PACE protocol and not only MTRD.

#### T.Skimming Capturing Card-Terminal Communication

Adverse action: An attacker imitates a PACE terminal (e.g. inspection system) in order to get access to the user data stored on or transferred between the TOE and the use (e.g. inspecting authority) connected via the contactless/contact interface of the TOE.

Threat agent: having high attack potential, cannot read and does not know the correct value of the shared password (PACE password) in advance.

Asset: confidentiality of application data (e.g. logical travel document data).

Application Note 11: MRZ is printed and CAN is printed or stuck on the travel document.

Please note that neither CAN nor MRZ effectively represent secrets, but are restricted-revealable, cf. OE.User\_Obligations.

## T. Eavesdropping Eavesdropping on the communication between the TOE and the PACE terminal

Adverse action: An attacker is listening to the communication between the TOE (e.g. travel document) and the PACE authenticated terminal (e.g. BIS-PACE) in order to gain the user data transferred between the TOE and the terminal connected.

Threat agent: having high attack potential, cannot read and does not know the correct value of the shared password (PACE password) in advance.

Asset: confidentiality of application data (e.g. logical travel document data).

#### T.Abuse-Func Abuse of Functionality

Adverse action: An attacker may use functions of the TOE which shall not be used in TOE operational phase in order (i) to manipulate or to disclose the User Data stored in the TOE, (ii) to manipulate or to disclose the TSF-data stored in the TOE or (iii) to manipulate (bypass, deactivate or modify) soft-coded security functionality of the TOE. This threat addresses the misuse of the functions for the initialization and personalization in the operational phase after delivery to the Application user\*.

Threat agent: having high attack potential, being in possession of one or more legitimate application data requiring PACE usage (e.g. travel document for MRTD).

Asset: integrity and authenticity of the application data requiring PACE usage (e.g. travel document for MRTD), availability of the functionality for the application data requiring PACE usage (e.g. travel document for MRTD).

Application note: for MRTD, Application user\* is travel document holder

## T.Information\_Leakage Information Leakage from travel document

Adverse action: An attacker may exploit information leaking from the TOE during its usage in order to disclose confidential User Data or/and TSF-data stored on the TOE and associated applications (e.g. travel document) or/and exchanged between the TOE and the terminal connected. The information leakage may be inherent in the normal operation or caused by the attacker.

Threat agent: having high attack potential

Asset: confidentiality of User Data and TSF-data including associated applications data requiring PACE usage (e.g. travel document for MRTD).

#### T.Phys-Tamper Physical Tampering

ST

Adverse action: An attacker may perform physical probing of the TOE and associated applications (e.g. travel document) in order (i) to disclose the TSF-data, or (ii) to disclose/reconstruct the TOE's Embedded Software. An attacker may physically modify the TOE and associated applications (e.g. travel document) in order to alter (I) its security functionality (hardware and software part, as well), (ii) the User Data or the TSF-data stored on the TOE and associated application data (e.g. travel document).

Threat agent: high attack potential, being in possession of one or more legitimate TOE and associated applications (e.g. travel documents).

Asset: integrity and authenticity of the TOE and associated application data (e.g. travel document), availability of the functionality of the TOE and associated application data (e.g. travel document), confidentiality of User Data and TSFdata of the TOE and associated application data (e.g. travel document)

## T.Malfunction Malfunction due to Environmental Stress

Adverse action: An attacker may cause a malfunction of the TOE (hardware and software) and associated applications by applying environmental stress in order to (i) deactivate or modify security features or functionality of the TOE' hardware or to (ii) circumvent, deactivate or modify security functions of the TOE's Embedded Software. This may be achieved e.g. by operating the TOE and associated applications (e.g. travel document) outside the normal operating conditions, exploiting errors in the TOE and associated applications (e.g. travel document) Embedded Software or misusing administrative functions. To exploit these vulnerabilities an attacker needs information about the functional operation.

Threat agent: having high attack potential, being in possession of one or more legitimate TOE and associated applications (e.g. travel documents), having information about the functional operation

Asset: integrity and authenticity of the TOE and associated applications (e.g. travel document), availability of the functionality of the TOE and associated applications (e.g. travel document), confidentiality of User Data and TSF-data of the TOE and associated applications (e.g. travel document).

Application note: A malfunction of the TOE may also be caused using a direct interaction with elements on the chip surface. This is considered as being a manipulation (refer to the threat T.Phys-Tamper) assuming a detailed knowledge about TOE's internals.

#### T.Forgery Forgery of Data

Adverse action: An attacker fraudulently alters the User Data or/and TSF-data stored on TOE or associated application (e.g. the travel document) or/and exchanged between the TOE and the terminal connected in order to outsmart the PACE authenticated terminal (e.g. BIS-PACE by means of changed Application user data\*. The attacker does it in such a way that the terminal connected perceives these modified data as authentic one.

Threat agent: having high attack potential Asset: Integrity of the travel document

Application note: Application user data is travel document holder data for MRTD (e.g. biographic or biometric data)

## 5.5 THREATS FROM GLOBAL PLATFORM SECURE ELEMENT PROTECTION PROFILE

This section introduces the threats to the assets against which specific protection within the TOE or its environment is required. The threats are classified in several groups.

# 5.5.1 Card Management

#### T.UNAUTHORISED-CARD-MGMT

Threat agent: Attacker

Adverse action: The attacker performs unauthorised card management operations (for instance impersonates one of the actors represented on the card) in order to take benefit of the privileges or services granted to this actor on the card and perform fraudulent operations:

- Load of a package file
- Installation of a package file
- Extradition of a package file or an applet
- Personalisation of an applet or an SD

Directly threatened asset(s): D.ISD\_KEYS, D.APSD\_KEYS, D.APP\_C\_DATA, D.APP\_I\_DATA, D.APP\_CODE, D.SEC\_DATA, D.PIN, and D.GP\_REGISTRY (any other asset may be jeopardised should this attack succeed, depending on the virulence of the installed application).

#### T.LIFE-CYCLE

Threat agent: Attacker

Adverse action: An attacker accesses an application outside of its expected availability range thus violating irreversible life cycle phases of the application (for instance, an attacker re-personalises the application). Directly threatened asset(s): **D.APP\_I\_DATA**, **D.APP\_C\_DATA**, and **D.GP\_REGISTRY**.

#### 5.5.2 Secure Communication

# T.COM-EXPLOIT

ST

Threat agent: Attacker

Adverse action: An attacker remotely exploits the communication channels established between a third party and the TOE in order to modify or disclose confidential data. Directly threatened asset(s): **All assets are threatened**.

# T.BRUTE-FORCE-SCP

Adverse action: APDU commands/API methods can be repeatedly transmitted/invoked to search the entire space of secret values such as cryptographic keys and attempt their brute force extraction. Directly threatened asset(s): **All** assets are threatened.

#### 5.6 SUPPLEMENTARY THREATS

# 5.6.1 GP SE - Package 'Cardholder Verification Method (CVM)' Threats

## T.CVM-IMPERSONATE

Threat agent: Attacker

Adverse action: An attacker could try to impersonate the Cardholder for disclosing or guessing the PIN stored in the CVM, in order to access the services the SE offers. Directly threatened asset(s): D.CVM PIN

#### T.CVM-UPDATE

Threat agent: Attacker

Adverse action: An attacker could try executing an application that tries to modify (reset/update) the CVM management data (Retry Limit, retry Counter, CVM value and state). Directly threatened asset(s): D.CVM MGMT STATE

#### T.BRUTE-FORCE-CVM

Threat agent: Attacker

Adverse action: APDU commands/API methods could be repeatedly transmitted/invoked to attempt the brute

force extraction of secrets such as PINs.

Directly threatened asset(s): D.CVM\_PIN, D.CVM\_MGMT\_STATE

# 5.6.2 GP SE - Package 'Delegated Management (DM)' Threats

#### T.RECEIPT

Threat agent: Attacker

Adverse action: The attacker may generate fake receipts in order to hide or falsify completion proofs of card

management operations.

Directly threatened asset(s): D.RECEIPT-GENERATION-KEY, D.CONFIRMATION-DATA

#### **T.TOKEN**

Threat agent: Attacker

Adverse action: The attacker may try to impersonate the Card Manager in order to gain access to the card and

perform illegitimate card management operations. Directly threatened asset(s): D.TOKEN-VERIFICATION-KEY

# 5.6.3 GP SE - Package 'DAP Verification' Threats

The Threats are thoses already defined in this security target:

- T.UNAUTHORISED-CARD-MGMT, T.COM-EXPLOIT from [PP-GP].
- T.INSTALL, T.INTEG-APPLI-CODE.LOAD, T.INTEG-APPLI-DATA.LOAD, T.INTEG-APPLI-CODE, and T.INTEGAPPLI-DATA from [PP-JC].

## 5.6.4 GP SE - Package 'Mandated DAP Verification' Threats

The Threats are thoses already defined in §5.6.3 - GP SE - Package 'DAP Verification' Threats:

# 5.6.5 GP SE - Package 'PP-Module OS Update' Threats

The following threats are related to patch loading in post-issuance.

#### T.UNAUTHORISED-TOE-CODE-UPDATE

An attacker attempts to update the TOE code with a malicious update that may compromise the security features of the TOE.

Targeted asset(s): D.OS-UPDATE ADDITIONALCODE, D.JCS CODE, D.JCS DATA.

#### T.FAKE-SGNVER-KEY

ST

An attacker modifies the signature verification key used by the TOE to verify the signature of the additional code. Hence, he is able to sign and successfully load malicious additional code inside the TOE. Targeted assets: D.OS-UPDATE\_SGNVER-KEY, D.OS-UPDATE\_ADDITIONALCODE.

#### T.WRONG-UPDATE-STATE

An attacker prevents the OS Update operation to be performed atomically, resulting in an inconsistency between the resulting TOE code and the identification data:

The additional code is not loaded within the TOE, but the identification data is updated to mention that the additional code is present;

The additional code is loaded within the TOE, but the identification data is not updated to indicate the change. Targeted asset: D.OS-UPDATE-CODE-ID.

#### T.INTEG-OS-UPDATE LOAD

The attacker modifies (part of) the additional code when it is transmitted to the TOE for installation. Targeted assets: D.OS-UPDATE\_ADDITIONALCODE, D.JCS\_CODE, D.JCS\_DATA.

#### T.CONFID-OS-UPDATE LOAD

The attacker discloses (part of) the additional code when it is transmitted to the TOE for installation.

Targeted assets: D.OS-UPDATE ADDITIONALCODE, D.JCS CODE, D.JCS DATA.

#### 5.7 ORGANIZATIONAL SECURITY POLICIES

# 5.7.1 OSP From Java Card System Protection Profile - Open Configuration

This section describes the organizational security policies to be enforced with respect to the TOE environment.

#### **OSP.VERIFICATION**

This policy shall ensure the consistency between the export files used in the verification and those used for installing the verified file. The policy must also ensure that no modification of the file is performed in between its verification and the signing by the verification authority. See #.VERIFICATION for details.

If the application development guidance provided by the platform developer contains recommendations related to the isolation property of the platform, this policy shall also ensure that the verification authority checks that these recommendations are applied in the application code.

#### 5.7.2 OSP From Global Platform Secure Element Protection Profile

This section describes the organizational security policies to be enforced with respect to the TOE environment.

#### **OSP.AID-MANAGEMENT**

When loading an application that uses shareable object interface, to make its services available to other applications, the VA shall verify that the AID of the application being loaded does not impersonate the AID known by another application on the card for the use of shareable services.

#### **OSP.LOADING**

Application code, validated or certified depending on the application, is loaded onto the SE Platform using any kind of CCM servers (e.g. OTA or other kinds of servers used to perform card content management) and protocols with contactless or contact (e.g. USB) connectivity.

If needed, the Issuer can pre-authorise content loading operation through delegated management privilege to an individual on-card representative of APs. In that case the application code is loaded in the APSD. Once loaded, the application is personalised using the appropriate SD keys.

#### **OSP.SERVERS**

A security policy shall be employed by the Issuer to ensure the security of the applications stored on its CCM servers (e.g. OTA or other kinds of servers used to perform card content management).

# **OSP.APSD-KEYS**

ST

The APSD keys personalisation can rely either on the key escrow if the APSD has been created before the usage phase of the SE card, or on the CA if the APSD has been created during the usage phase.

In the first case, the APSD keys are generated and stored in a secure way by the personaliser. Then, these keys are transmitted to the AP, via the key escrow. In the second case, one of the following must occur:

- The APSD keys are generated and stored in a secure way by the APSD, then securely transmitted to the AP using the CASD.
- Or the APSD keys are created by the AP and securely transferred to the APSD using the CASD...

Ref: D1569436\_LITE Rev: 1.25 Page: 55 / 189

#### **OSP.ISD-KEYS**

The security of the ISD keys shall be ensured by a well-defined security policy that covers generation, storage, distribution, destruction, and recovery. This policy is enforced by the Issuer in collaboration with the personaliser.

#### **OSP.KEY-GENERATION**

The personaliser shall enforce a policy ensuring that generated keys cannot be accessed in plaintext.

#### **OSP.CASD-KEYS**

The CASD keys shall be securely generated and stored in the SE card during the personalisation process. These keys are not modifiable after card issuance.

#### **OSP.KEY-CHANGE**

The AP shall change its initial keys before any operation on its APSD.

#### OSP.SECURITY-DOMAINS

SDs can be dynamically created, deleted, and blocked during usage phase, i.e. post-issuance.

#### OSP.APPLICATIONS

ST

The applications intending to be used with the TOE shall follow the TOE's security guidance and recommendations

## 5.7.3 OSP associated to PACE Module

Note: OSP naming rules for this module (P.X) is coming from [PP\_PACE] and remains unchanged for compatibility reason.

#### P.Terminal Abilities and trustworthiness of terminals

The Basic Inspection Systems with PACE (BIS-PACE) shall operate their terminals as follows:

- 1.) The related terminals (basic inspection system, cf. above) shall be used by terminal operators and by Applicative users as defined in [PKI].
- 2.) They shall implement the terminal parts of the PACE protocol [ICAO-TR-SAC], of the Passive Authentication [PKI] and use them in this order. The PACE terminal shall use randomly and (almost) uniformly selected nonces, if required by the protocols (for generating ephemeral keys for Diffie-Hellmann).
- 3.) The related terminals need not to use any own credentials.
- 4.) The related terminals and their environment shall ensure confidentiality and integrity of respective data handled by them (e.g. confidentiality of PACE passwords, etc.), where it is necessary for a secure operation of the TOE.

Application note: Applicative user is travel document holder in MTRD context.

#### P.Personalisation Personalisation of the applicative data by authorized issuing actor only

The issuer\* guarantees the correctness of the user data to be included in TOE in Personalisation phase. In particular, the issuer\* guarantees user data are consistent with respect of the end user of the TOE.

Application note: For MRTD application, the issuer is here "issuing State or Organisation", the user data includes at least, "the biographical data, the printed portrait and the digitized portrait, the biometric reference data and other data of the logical travel document" and the end user is "the travel document holder". The personalisation of the travel document for the holder is performed by an agent authorized by the issuing State or Organisation only.

#### P.Manufact Manufacturing of the TOE with Initialization Data for application.

The Initialization Data are written by the IC Manufacturer to identify the IC uniquely. The FF Manufacturer writes the Pre-personalisation Data which contains at least the Personalisation Agent Key.

# P.Pre-Operational Pre-operational handling of the TOE and associated applications

- The Issuer issues the TOE and associated applications (e.g. travel document) and approves it using the terminals complying with all applicable laws and regulations.
- The Issuer guarantees correctness of the user data (amongst other of those, concerning the application user (e.g.travel document holder) and of the TSF-data permanently stored in the TOE¹.
- The Issuer uses only such TOE's technical components (IC) which enable traceability of the TOE and associated applications (e.g. travel documents) in their manufacturing and issuing life cycle phases, i.e. <u>before</u> they are in the operational phase.

If the Issuer authorises a Personalisation Agent to personalise the TOE and associated applications (e.g. travel documents) for application user (e.g. travel document holder), the Issuer has to ensure that the Personalisation Agent acts in accordance with the Issuer's policy.

#### 5.7.4 TOE additional OSP

# 5.7.4.1 JCS Additional OSP

# OSP.SpecificAPI

The TOE must contribute to ensure that application can optimize control on its sensitive operations using a dedicated API provided by TOE. TOE will provide services for secure array management and to detect loss of data integrity and inconsistent execution flow and react against tearing or fault induction.

#### **OSP.RNG**

This policy shall ensure the entropy of the random numbers provided by the TOE to applet using [JCAPI3] is sufficient. Thus attacker is not able to predict or obtain information on generated numbers.

# 5.7.4.2 GP-SE - Package 'Cardholder Verification Method (CVM)' OSP

No additional OSP

# 5.7.4.3 GP-SE - Package 'Delegated Management (DM)' OSP

#### **OSP.TOKEN-GEN**

The Token must be generated securely by a trusted entity according to the signature algorithms defined in GlobalPlatform specifications.

Application Note: See [GP23] sections B.1, B.2, B.3, B.4, and C.4.

#### **OSP.RECEIPT-VER**

The Receipt must be verified securely by a trusted entity according to the methods defined in GlobalPlatform specifications.

Application Note: See [GP23] sections B.1, B.2, B.3, B.4, and C.5.

### 5.7.4.4 GP-SE - Package 'DAP Verification' OSP

#### **OSP.DAP BLOCK GEN**

The DAP Block must be generated securely by a trusted entity that verifies the content of the Load File Data Block linked to the hash.

ST Ref: D1569436\_LITE Rev: 1.25

<sup>&</sup>lt;sup>1</sup> cf. Table 4 and Table 5 above

# 5.7.4.5 GP-SE - Package 'Mandated DAP Verification' OSP

No additional OSP

# 5.7.4.6 GP-SE - Package 'PP-Module OS Update' OSP

#### OSP.ATOMIC ACTIVATION

Additional code has to be loaded and installed on the Initial TOE through an atomic activation to create the Updated TOE.

Each additional code shall be identified with unique Identification Data. During such atomic activation, identification Data of the Initial TOE have to be updated to clearly identify the Updated TOE.

In case of interruption or incident during activation, the TOE shall remain in its initial state or fail secure.

#### OSP.TOE IDENTIFICATION

Identification Data of the resulting Updated TOE shall identify the Initial TOE and the activated additional code. Identification Data shall be protected in integrity.

#### OSP.ADDITIONAL CODE SIGNING

The additional code has to be signed with a cryptographic key according to relevant standards, and the generated signature is associated with the additional code.

The additional code signature must be verified during loading to assure its authenticity and integrity and to assure that loading is authorised on the TOE.

The cryptographic key used to sign the additional code shall be of sufficient quality and its generation shall be appropriately secured to ensure the authenticity, integrity, and confidentiality of the key.

#### OSP.ADDITIONAL CODE ENCRYPTION

The additional code has to be encrypted according to the relevant standard in order to ensure its confidentiality when it is transmitted to the TOE for loading and installation.

The encryption key shall be of sufficient quality and its generation shall be appropriately secured to ensure the confidentiality, authenticity, and integrity of the key.

#### 5.8 ASSUMPTIONS

This section introduces the assumptions made on the environment of the TOE.

#### 5.8.1 Assumptions from Java Card System Protection Profile - Open Configuration

# A. CAP\_FILE

ST

CAP Files loaded post-issuance do not contain native methods. The Java Card specification explicitly "does not include support for native methods" ([JCVM3], §3.3) outside the API.

# **A.VERIFICATION**

All the bytecodes are verified at least once, before the loading, before the installation or before the execution, depending on the card capabilities, in order to ensure that each bytecode is valid at execution time.

#### 5.8.2 Assumptions associated to PACE Module

#### A.Insp Sys Inspection Systems for global interoperability

The Extended Inspection System (EIS) for global interoperability (i) implements at least the terminal part of PACE [ICAOTR-SAC]. If several protocols are supported by the EIS, PACE secure channel must be established and applicative data (e.g. the logical travel document) must be transferred under PACE. Other operations may be done when additional protocols are supported by the terminal.

# 5.8.3 Assumptions from Global Platform Secure Element Protection Profile

#### **A.ISSUER**

This is the entity that owns the SE and is ultimately responsible for the behaviour of the SE.

#### A.ADMIN

These administrators of the CCM servers (e.g. OTA or other kinds of servers) used to perform card content management are trusted actors. They are trained to use and administrate those servers securely. They have the means and the equipment to perform their tasks. They are aware of the sensitivity of the assets they manage and the responsibilities associated with the administration of CCM servers.

Administrators obey the security policies and constitute, by this assumption, no source of an inside attack.

## **A.APPS-PROVIDER**

The AP is a trusted actor that provides applications. APs are responsible for their APSD keys.

#### **A.VERIFICATION-AUTHORITY**

The VA is a trusted actor with the capability to check and validate the digital signature of an application.

#### A.KEY-ESCROW

The key escrow is a trusted actor in charge of the secure storage of the initial APSD keys generated by the TOE personaliser during the initial personalisation.

#### A.PERSONALISER

The personaliser is in charge of the TOE personalisation process, which ensures the security of the keys loaded in the SE:

- Issuer Security Domain keys (ISD keys)
- Application Provider Security Domains keys (APSD keys)
- Controlling Authority Security Domain keys (CASD keys)

#### A.CONTROLLING-AUTHORITY

The CA is a trusted actor different from the issuer responsible for the CASD keys and associated services.

## A.PRODUCTION

Security procedures are used after TOE Delivery up to delivery to the end consumer to maintain the confidentiality and integrity of the TOE and its data (to prevent any possible copy, modification, retention, theft, or unauthorised use).

#### A.SCP-SUPP

The operational environment supports and uses the SCPs offered by the TOE.

## A.KEYS-PROT

The keys stored outside the TOE and applied for secure communication and authentication between the SE and the external entities are confidentiality and integrity protected in their storage environment. This covers D.APSD\_KEYS and D.ISD\_KEYS.

#### 5.8.4 TOE Additional Assumptions

5.8.4.1 GP-SE - Package 'Cardholder Verification Method (CVM)' Assumptions

No additional Assumptions

5.8.4.2 GP-SE - Package 'Delegated Management (DM)' Assumptions

No additional Assumptions

5.8.4.3 GP-SE - Package 'DAP Verification' OSP

No additional Assumptions

ST

5.8.4.4 GP-SE - Package 'Mandated DAP Verification' OSP

No additional Assumptions

# 5.8.4.5 GP-SE - Package 'PP-Module OS Update' Assumptions

#### A.OS-UPDATE-EVIDENCE

For additional code loaded pre-issuance, it is assumed that evaluated technical and/or audited organisational measures have been implemented to ensure that the additional code:

- 1. has been issued by the genuine OS Developer
- 2. has not been altered since it was issued by the genuine OS Developer.

For additional code loaded post-issuance, it is assumed that the OS Developer provides digital evidence to the TOE in order to prove the following:

- 1. he is the genuine developer of the additional code and
- 2. the additional code has not been modified since it was issued by the genuine OS Developer.

#### A.SECURE ACODE MANAGEMENT

It is assumed that:

ST

- The Key management process related to the OS Update capability takes place in a secure and audited environment.
- The cryptographic keys used by the cryptographic operations are of strong quality and appropriately secured to ensure confidentiality, authenticity, and integrity of those keys.

# 6 SECURITY OBJECTIVES

## 6.1 SECURITY OBJECTIVES FOR THE TOE

This section defines the security objectives to be achieved by the TOE.

# 6.1.1 Security objectives for the TOE from Java Card System Protection Profile - Open Configuration

This section defines the security objectives to be achieved by the TOE.

#### 6.1.1.1 Identification

#### O.SID

The TOE shall uniquely identify every subject (applet, or CAP file) before granting it access to any service.

## 6.1.1.2 Execution

#### O.FIREWALL

The TOE shall ensure controlled sharing of data containers owned by applets of different CAP file, or the JCRE and between applets and the TSFs. See #.FIREWALL for details.

#### O.GLOBAL ARRAYS CONFID

The TOE shall ensure that the APDU buffer that is shared by all applications is always cleaned upon applet selection. The TOE shall ensure that the global byte array used for the invocation of the install method of the selected applet is always cleaned after the return from the install method.

#### O.GLOBAL ARRAYS INTEG

The TOE shall ensure that no application can store a reference to the APDU buffer, a global byte array created by the user through makeGlobalArray method and the byte array used for invocation of the install method of the selected applet.

#### **O.ARRAY VIEWS CONFID**

The TOE shall ensure that no application can read elements of an array view not having array view security attribute ATTR\_READABLE\_VIEW.

The TOE shall ensure that an application can only read the elements of the array view within the bounds of the array view.

#### O. ARRAY\_VIEWS\_INTEG

The TOE shall ensure that no application can write to an array view not having array view security attribute ATTR\_WRITABLE\_VIEW.

The TOE shall ensure that an application can only write within the bounds of the array view.

#### O.NATIVE

The only means that the Java Card VM shall provide for an application to execute native code is the invocation of a method of the Java Card API, or any additional API. See #.NATIVE for details.

#### O.OPERATE

The TOE must ensure continued correct operation of its security functions. See #.OPERATE for details.

#### **O.REALLOCATION**

The TOE shall ensure that the re-allocation of a memory block for the runtime areas of the Java Card VM does not disclose any information that was previously stored in that block.

#### **O.RESOURCES**

ST

The TOE shall control the availability of resources for the applications. See #.RESOURCES for details.

## 6.1.1.3 Services

#### O.ALARM

The TOE shall provide appropriate feedback information upon detection of a potential security violation. See #.ALARM for details.

#### **O.CIPHER**

The TOE shall provide a means to cipher sensitive data for applications in a secure way. In particular, the TOE must support cryptographic algorithms consistent with cryptographic usage policies and standards. See #.CIPHER for details.

#### O.RNG

The TOE shall ensure the cryptographic quality of random number generation. For instance random numbers shall not be predictable and shall have sufficient entropy.

The TOE shall ensure that no information about the produced random numbers is available to an attacker since they might be used for instance to generate cryptographic keys.

#### O.KEY-MNGT

The TOE shall provide a means to securely manage cryptographic keys. This concerns the correct generation, distribution, access and destruction of cryptographic keys. See #.KEY-MNGT.

#### O.PIN-MNGT

The TOE shall provide a means to securely manage PIN objects (including the PIN try limit, PIN try counter and states). If the PIN try limit is reached, no further PIN authentication must be allowed. See #.PIN-MNGT for details.

## Application note:

PIN objects may play key roles in the security architecture of client applications. The way they are stored and managed in the memory of the smart card must be carefully considered, and this applies to the whole object rather than the sole value of the PIN. For instance, the try limit and the try counter's value are as sensitive as that of the PIN and the TOE must restrict their modification only to authorized applications such as the card manager.

#### **O.TRANSACTION**

The TOE must provide a means to execute a set of operations atomically. See #.TRANSACTION for details.

O.KEY-MNGT, O.PIN-MNGT, O.TRANSACTION, O.RNG and O.CIPHER are actually provided to applets in the form of Java Card APIs. Vendor-specific libraries can also be present on the card and made available to applets; those may be built on top of the Java Card API or independently.

## 6.1.1.4 Object deletion

#### **O.OBJ-DELETION**

The TOE shall ensure the object deletion shall not break references to objects. See #.OBJ-DELETION for further details.

## 6.1.1.5 Applet management

#### O.DELETION

The TOE shall ensure that both applet and CAP file deletion perform as expected. (See #.DELETION for details).

#### O.LOAD

ST

The TOE shall ensure that the loading of a CAP file into the card is safe.

Besides, for codes loaded post-issuance, the TOE shall verify the integrity and authenticity evidences generated during the verification of the application CAP file by the verification authority. This verification by the TOE shall occur during the load or late during the install process.

## Application Note:

Usurpation of identity resulting from a malicious installation of an applet on the card may also be the result of perturbing the communication channel linking the CAD and the card. Even if the CAD is placed in a secure environment, the attacker may try to capture, duplicate, permute or modify the CAP files sent to the card. He may also try to send one of its own applications as if it came from the card issuer. Thus, this objective is intended to ensure the integrity and authenticity of loaded CAP files.

#### O.INSTALL

The TOE shall ensure that the installation of an applet performs as expected. (See #.INSTALL for details). Besides, for codes loaded post-issuance, the TOE shall verify the integrity and authenticity evidences generated during the verification of the application CAP file by the verification authority. If not performed during the loading process, this verification by the TOE shall occur during the install process.

## 6.1.1.6 SCP

The Objectives described in this section are Objectives for the Environment in [PP-JCS-Open]. They become Objectives for the TOE because the TOE in this ST includes the SCP.

#### O.SCP.RECOVERY

If there is a loss of power, or if the smart card is withdrawn from the CAD while an operation is in progress, the SCP must allow the TOE to eventually complete the interrupted operation successfully, or recover to a consistent and secure state.

This security objective of the TOE refers to the security aspect #.SCP.1: The smart card platform must be secure with respect to the SFRs. Then after a power loss or sudden card removal prior to completion of some communication protocol, the SCP will allow the TOE on the next power up to either complete the interrupted operation or revert to a secure state.

#### O.SCP.SUPPORT

The SCP shall support the TSFs of the TOE.

This security objective of the TOE refers to the security aspect 2, 3, 4 and 5 of #.SCP

- (2) It does not allow the TSFs to be bypassed or altered and does not allow access to other low-level functions than those made available by the CAP file of the API. That includes the protection of its private data and code (against disclosure or modification) from the Java Card System.
- (3) It provides secure low-level cryptographic processing to the Java Card System.
- (4) It supports the needs for any update to a single persistent object or class field to be atomic, and possibly a low-level transaction mechanism.
- (5) It allows the Java Card System to store data in "persistent technology memory" or in volatile memory, depending on its needs (for instance, transient objects must not be stored in non-volatile memory). The memory model is structured and allows for low-level control accesses (segmentation fault detection).

#### O.SCP.IC

The SCP shall provide all IC security features against physical attacks.

This security objective for of the TOE refers to the point (7) of the security aspect #.SCP:

It is required that the IC is designed in accordance with a well-defined set of policies and Standards (likely specified in another protection profile), and will be tamper resistant to actually prevent an attacker from extracting or altering security data (like cryptographic keys) by using commonly employed techniques (physical probing and sophisticated analysis of the chip). This especially matters to the management (storage and operation) of cryptographic keys.

# 6.1.1.7 CMGR

ST

The Objectives described in this section are Objectives for the Environment in [PP-JCS-Open]. They become Objectives for the TOE because the TOE in this ST includes the Card Manager.

#### O.CARD-MANAGEMENT (Deprecated: See O.CARD-MANAGEMENT in §6.1.2.1)

The card manager shall control the access to card management functions such as the installation, update or deletion of applets. It shall also implement the card issuer's policy on the card.

The card manager is an application with specific rights, which is responsible for the administration of the smart card. This component will in practice be tightly connected with the TOE, which in turn shall very likely rely on the card manager for the effective enforcing of some of its security functions. Typically the card manager shall be in charge of the life cycle of the whole card, as well as that of the installed applications (applets). The card manager should prevent that card content management (loading, installation, deletion) is carried out, for instance, at invalid states of the card or by nonauthorized actors. It shall also enforce security policies established by the card issuer.

# 6.1.2 Security objectives for the TOE from Global Platform Secure Element Protection Profile

# 6.1.2.1 Card Management

| O.CARD-                | The TOE shall provide the card manager as defined in [GP23].  |
|------------------------|---|
| MANAGEMENT             | The card manager shall control the access to card management functions such as the installation, update, or deletion of applets. It shall also implement the Issuer's policy on the card.   |
|                        | The card manager is an application with specific rights (e.g. ISD), which is responsible for the administration of the SE. Typically, the card manager shall be in charge of the life cycle of the whole card, as well as that of the installed applications (applets). The card manager shall prevent card content management operations (loading, installation, deletion) from being carried out, for instance, at invalid states of the card or by unauthorised actors. It shall also enforce security policies established by the Issuer. |
| O.DOMAIN-RIGHTS        | The Issuer shall not access or change personalised APSD keys, which belong exclusively to the AP. Modification of an SD key set is restricted to the AP owning the SD.  |
| O.APPLI-AUTH           | The card manager shall enforce the application security policies established by the Issuer. The enforcement shall be implemented by requiring application authentication during application loading on the card.  |
| O.SECURITY-<br>DOMAINS | SDs can be dynamically created, deleted, and blocked during the end use phase.  |

# 6.1.2.2 Secure Element

| O.COMM-AUTH                | The TOE shall authenticate the origin of the card management requests received by the card, and authenticate itself to the remote actor. |  |
|----------------------------|--|--|
| O.COMM-INTEGRITY           | The TOE shall verify the integrity of the (card management) requests that the card receives.   |  |
| O.COMM-<br>CONFIDENTIALITY | The TOE shall be able to process card management requests containing encrypted data.   |  |
| O.NO-KEY-REUSE             | The TOE shall ensure that session keys can be used only once.  |  |

ST

# 6.1.2.3 Privileges and Life Cycle Management

| O.PRIVILEGES-<br>MANAGEMENT | The TOE shall provide Privileges assignment and management functionalities for the oncard entities ISD, SSD, and Applications. The TOE shall control the access to the Privileges assignment and management functions.                |
|-----------------------------|---|
| O.LC-MANAGEMENT             | The TOE shall provide a state machine that enforces the TOE's life cycle, keeps track of the TOE's current state, and controls that the operations required by the users are consistent with the current life cycle state of the TOE. |
|                             | The TOE shall provide Life Cycle (LC) management functionalities for the Card, ELFs, SDs, and Applications.   |

# 6.1.3 Security objectives for the TOE from PACE Module

This section describes the security objectives for the TOE addressing the aspects of identified threats to be countered by the PACE Module of TOE and organisational security policies to be met by the PACE Module of TOE.

Note: TOE objectives naming rules for this module (OT.X) is coming from [PP\_PACE] and remains unchanged for compatibility reason.

## OT.AC\_Pers Access Control for Personalisation of TOE and Applicative data

The TOE must ensure that the TOE and Application data requiring PACE usage\* and associated TSF data can be written by authorized Personalisation Agents only in personalisation phase. The TOE and Application data requiring PACE usage (e.g. logical travel document data in EF.DG1 to EF.DG16) and associated TSF data may be written only during and cannot be changed after personalisation phase.

Application note: Application data requiring PACE usage\* for MRTD is PACE data, and MTRD data as logical travel document data in EF.DG1 to EF.DG16, the Document Security Object according to LDS [PKI]).

#### OT.Data\_Integrity Integrity of Data

The TOE must ensure integrity of the User Data and the TSF-data stored on it by protecting these data against unauthorised modification (physical manipulation and unauthorised modifying). The TOE must ensure integrity of the User Data and the TSF-data during their exchange between the TOE and the terminal connected (and represented by PACE authenticated BIS-PACE) after the PACE Authentication.

# OT.Data\_Authenticity Authenticity of Data

The TOE must ensure authenticity of the User Data and the TSF-data stored on it by enabling verification of their authenticity at the terminal-side. The TOE must ensure authenticity of the User Data and the TSF-data during their exchange between the TOE and the terminal connected (and represented by PACE authenticated BIS-PACE) after the PACE Authentication. It shall happen by enabling such a verification at the terminal-side (at receiving by the terminal) and by an active verification by the TOE itself (at receiving by the TOE).

# OT.Data\_Confidentiality Confidentiality of Data

The TOE must ensure confidentiality of the User Data and the TSF data by granting read access only to the PACE authenticated BIS-PACE connected. The TOE must ensure confidentiality of the User Data and the TSF-data during their exchange between the TOE and the terminal connected (and represented by PACE authenticated BIS-PACE) after the PACE Authentication.

#### OT.Identification Identification of the TOE

ST

The TOE must provide means to store Initialisation and Pre-Personalisation Data in its non-volatile memory. The Initialisation Data must provide a unique identification of the IC during the manufacturing and the card issuing life cycle phases of the application data requiring PACE usage (e.g. travel document for MRTD). The storage of the PrePersonalisation data includes writing of the Personalisation Agent Key(s).

#### OT.Prot\_Abuse\_Func Protection against Abuse of Functionality

The TOE must prevent that functions of the TOE, which may not be used in TOE operational phase, can be abused in order (i) to manipulate or to disclose the User Data stored in the TOE, (ii) to manipulate or to disclose the TSF-data stored in the TOE, (iii) to manipulate (bypass, deactivate or modify) soft-coded security functionality of the TOE.

## OT.Prot Inf Leak Protection against Information Leakage

The TOE must provide protection against disclosure of confidential User Data or/and TSF-data stored and/or processed by the TOE

• by measurement and analysis of the shape and amplitude of signals or the time between events found by measuring signals on the electromagnetic field, power consumption, clock, or I/O lines, 

by forcing a malfunction of the TOE and/or 

by a physical manipulation of the TOE.

Application note: This objective pertains to measurements with subsequent complex signal processing due to normal operation of the TOE or operations enforced by an attacker.

#### OT.Prot\_Phys\_Tamper Protection against Physical Tampering

The TOE must provide protection of confidentiality and integrity of the User Data, the TSF-data and the TOE's Embedded Software by means of

- measuring through galvanic contacts representing a direct physical probing on the chip's surface except on pads being bonded (using standard tools for measuring voltage and current) or
- measuring not using galvanic contacts, but other types of physical interaction between electrical charges (using tools used in solid-state physics research and IC failure analysis),
- manipulation of the hardware and its security functionality, as well as
- controlled manipulation of memory contents (User Data, TSF-data)
- · with a prior reverse-engineering to understand the design and its properties and functionality.

## **OT.Prot Malfunction Protection against Malfunctions**

The TOE must ensure its correct operation. The TOE must prevent its operation outside the normal operating conditions where reliability and secure operation have not been proven or tested. This is to prevent functional errors in the TOE. The environmental conditions may include external energy (esp. electromagnetic) fields, voltage (on any contacts), clock frequency or temperature.

The following TOE security objectives address the aspects of identified threats to be countered involving TOE's environment.

Other security objectives for TOE from [PP EAC2] are specific to travel document and are not copied here.

#### 6.1.4 Additional objectives

#### 6.1.4.1 Objectives of additional services provided to applications by the TOE

Objectives described in this section are additional objectives related to the TOE.

#### O.SpecificAPI

The TOE shall provide to application a specific API means to optimize control on sensitive operations performed by application.

TOE shall provide services for secure array management and to detect loss of data integrity and inconsistent execution flow and react against tearing or fault induction.

## 6.1.4.2 Objectives of GP-SE - Package 'Cardholder Verification Method (CVM)'

## O.GLOBAL-CVM

The TOE shall restrict the modification of the security attributes of the CVM only to defined privileged applications appointed by the Card Manager. Any SD allowed to perform CVM can grant the CVM privilege to an Application.

#### O.CVM-BLOCK

ST

If the maximum number of attempts has been reached, further Cardholder authentication attempts are blocked. The blocking can be removed by special action of the Card Manager or a privileged user.

#### O.CVM-MGMT

The TOE shall provide means to securely manage CVM objects. Secure management of CVM objects includes:

- Atomic update of PIN code and of the try counter,
- No rollback of the number of unsuccessful authentication attempts,
- Protection of confidentiality of the PIN value,
- Protection of the PIN comparison process against observation.

# 6.1.4.3 Objectives of GP-SE - Package 'Delegated Management (DM)'

#### **O.RECEIPT**

The TOE shall generate non-repudiable receipts of the completion of card management operations. The generation of the receipt shall be performed by an SD with 'Receipt Generation' Privilege.

#### O.TOKEN

The TOE shall verify tokens during the processing of card management operations. The verification of the token shall be performed by an SD with 'Token Verification' Privilege.

# 6.1.4.4 Objectives of GP-SE - Package 'DAP Verification'

The Objectives for this packages are:

- O.CARD-MANAGEMENT, O.APPLI-AUTH from [PP-GP].
- O.LOAD, O.INSTALL and O.CIPHER from [PP-JC].

No Additional Objectives

# 6.1.4.5 Objectives of GP-SE - Package 'Mandated DAP Verification'

No Additional Objectives

#### 6.1.4.6 Objectives of GP-SE - Package 'PP-Module OS Update'

Security Target of a TOE embedding a Loader shall include the following Security Objectives.

# O.SECURE\_LOAD\_ACODE

The TOE shall check an evidence of authenticity and integrity of the additional code to be loaded.

The TOE enforces that only an allowed version of the additional code can be loaded. The TOE shall forbid the loading of an additional code not intended to be assembled with the TOE. During the loading of the additional code, the TOE shall remain secure.

#### O.SECURE\_AC\_ACTIVATION

Activation of the additional code and update of the Identification Data shall be performed at the same time in an atomic way. All the operations needed for the code to be able to operate as in the Updated TOE shall be completed before activation.

If the atomic activation is successful, then the resulting product is the Updated TOE, otherwise (in case of interruption or incident which prevents the forming of the Updated TOE), the TOE shall preserve a secure state.

#### O.TOE IDENTIFICATION

ST

The TOE provides means to store Identification Data in its non-volatile memory and guarantees the integrity of these data.

After atomic activation of the additional code, the Identification Data of the Updated TOE allows identifications of both the Initial TOE and additional code.

The user must be able to uniquely identify Initial TOE and additional code(s) which are embedded in the Updated TOE.

#### O.CONFID-OS-UPDATE.LOAD

The TOE shall decrypt the additional code prior installation.

Application Note: Confidentiality protection must be enforced when the additional code is transmitted to the TOE for loading (See OE.OS-UPDATE-ENCRYPTION later in this table). Confidentiality protection can be achieved either through direct encryption of the additional code, or by means of a trusted path ensuring the confidentiality of the communication to the TOE.

#### 6.2 SECURITY OBJECTIVES FOR THE OPERATIONAL ENVIRONMENT

# 6.2.1 Security Objectives for the Operational Environment from Java Card System Protection Profile – Open Configuration

This section introduces the security objectives to be achieved by the environment and extracted from [PP-JCS-Open].

#### **OE.VERIFICATION**

All the bytecodes shall be verified at least once, before the loading, before the installation or before the execution, depending on the card capabilities, in order to ensure that each bytecode is valid at execution time. See #.VERIFICATION for details.

Additionally the applet shall follow all recommendations, if any, mandated in the platform guidance for maintaining the isolation property of the platform.

**Application Note:** 

Constraints to maintain the isolation property of the platform are provided by the platform developer in application development guidance. The constraints apply to all application code loaded in the platform.

#### **OE.CAP FILE**

No CAP file loaded post-issuance shall contain native methods.

#### **OE.CODE-EVIDENCE**

For application code loaded pre-issuance, evaluated technical measures implemented by the TOE or audited organizational measures must ensure that loaded application has not been changed since the code verifications required in OE.VERIFICATION.

For application code loaded post-issuance and verified off-card according to the requirements of OE.VERIFICATION, the verification authority shall provide digital evidence to the TOE that the application code has not been modified after the code verification and that he is the actor who performed code verification.

For application code loaded post-issuance and partially or entirely verified on-card, technical measures must ensure that the verification required in OE.VERIFICATION are performed. On-card bytecode verifier is out of the scope of this Protection Profile

#### **Application Note:**

ST

For application code loaded post-issuance and verified off-card, the integrity and authenticity evidence can be achieved by electronic signature of the application code, after code verification, by the actor who performed verification.

# 6.2.2 Security Objectives for the Operational Environment from Global Platform Secure Element Protection Profile

This section introduces the security objectives to be achieved by the environment and extracted from [PP-GP].

# 6.2.2.1 Actors

| OE.ISSUER                     | The Issuer shall be a trusted actor responsible for the behaviour of the SE.  |  |
|-------------------------------|---|--|
| OE.ADMIN                      | The administrators of the CCM servers (e.g. OTA or other kinds of servers) shall be trusted actors. They shall be trained to use and administrate those servers. They have the means and the equipment to perform their tasks. They must be aware of the sensitivity of the assets they manage and the responsibilities associated with the administration of CCM servers. Administrators obey the security policies and constitute, by this OE, no source of an inside attack. |  |
| OE.APPS-PROVIDER              | The AP shall be a trusted actor that provides applications. The AP must be responsible for the APSD keys.   |  |
| OE.VERIFICATION-<br>AUTHORITY | The VA shall be a trusted actor with the capability to check and validate the digital signature attached to an application.   |  |
| OE.KEY-ESCROW                 | The key escrow shall be a trusted actor in charge of the secure storage of the AP initial keys generated by the personaliser.   |  |
| OE.PERSONALISER               | The personaliser shall be a trusted actor in charge of the personalisation process. The personaliser shall ensure the security of the keys managed and loaded into the card:  |  |
|                               | <ul> <li>Issuer Security Domain keys (ISD keys),</li> <li>Application Provider Security Domain keys (APSD keys),</li> <li>Controlling Authority Security Domain keys (CASD keys).</li> </ul>  |  |
| OE.CONTROLLING-<br>AUTHORITY  | The CA shall be a trusted actor responsible for securing the creation and personalisation of APSD keys. The CA must be responsible for the CASD keys.   |  |
| OE.SCP-SUPP                   | Secure Communication Protocols shall be supported and used by the operational environment.  |  |
| OE.KEYS-PROT                  | During the TOE's use, the terminal in interaction with the TOE shall ensure the protection (integrity and confidentiality) of the applied keys by operational means and/or procedures.  |  |

# 6.2.2.2 Secure Place

| OE.PRODUCTION | Security procedures shall be used after TOE Delivery up to delivery to the end    |
|---------------|---|
|               | consumer to maintain confidentiality and integrity of the TOE and of its data (to |
|               | prevent any possible copy, modification, retention, theft, or unauthorised use).  |

# 6.2.2.3 Validation

| OE.APPLICATIONS   | Developers and Validators shall comply with the security guidance and ensure that the rules are enforced.   |
|-------------------|---|
| OE.AID-MANAGEMENT | The VA shall verify that the AID of the application being loaded does not impersonate the AID known by another application on the card for the use of shareable services. |

# 6.2.2.4 Loading

| OE.LOADING | Application code, validated or certified depending on the application, is loaded onto the SE Platform using any kind of CCM servers (e.g. OTA or other kinds of servers used to perform card content management) and protocols with contactless or contact (e.g. USB) connectivity. |
|------------|---|
| OE.SERVERS | The Issuer must enforce a policy to ensure the security of the applications stored on its CCM servers (e.g. OTA or other kinds of servers used to perform card content management).   |

## 6.2.2.5 Keys

ST

| OE.AP-KEYS        | The SD-key-personaliser, the AP, and the key escrow must enforce a security policy securing the transmissions. |
|-------------------|--|
| OE.ISD-KEYS       | The security of the ISD keys must be ensured in the environment of the TOE.                                    |
| OE.KEY-GENERATION | The personaliser must ensure that the generated keys cannot be accessed by unauthorised users.                 |
| OE.CA-KEYS        | The CASD keys must be securely generated prior to storage in the SE card.                                      |
| OE.KEY-CHANGE     | The AP must change the initial keys of APSD before any operation on it.  |

# 6.2.3 Security Objectives for the Operational Environment from PACE Module

### OE.Prot\_Logical\_Data Protection of TOE and applicative data

The inspection system of the applicative entity (e.g. receiving State or Organisation) ensures the confidentiality and integrity of the data read from the TOE and applicative data (e.g. logical travel document). The inspection system will prevent eavesdropping to their communication with the TOE before secure messaging is successfully established.

## OE.Personalisation Personalisation of TOE and application data requiring PACE usage

The Issuer must ensure that the Personalisation Agents acting on his behalf (i) establish the correct identity of the applicative user (e.g. travel document holder) and create the accurate applicative data\* and write them in TOE.

Note: in the specific case of MRTD, accurate applicative data are biographical data for the travel document), (ii) biometric reference data of the travel document holder, the initial TSF data, (the Document Security Object defined in [PKI] (in the role of a DS).

## **OE.Terminal Terminal operating**

The terminal operators must operate their terminals as follows:

- 1.) The related terminals (basic inspection systems, cf. above) are used by terminal operators and by travel document holders as defined in as defined in [ICAO-9303].
- 2.) The related terminals implement the terminal parts of the PACE protocol [ICAO-TR-SAC], of the Passive Authentication [ICAO-TR-SAC] (by verification of the signature of the Document Security Object) and use them in this order (This order is commensurate with [ICAO-TR-SAC]. The PACE terminal uses randomly and (almost) uniformly selected nonces, if required by the protocols (for generating ephemeral keys for Diffie-Hellmann).
- 3.) The related terminals need not to use any own credentials.
- 4.) The related terminals securely store the Country Signing Public Key and the Document Signer Public Key (in form of C<sub>CSCA</sub> and C<sub>DS</sub>) in order to enable and to perform Passive Authentication of the travel document (determination of the authenticity of data groups stored in the travel document, [ICAO-9303]).
- 5.) The related terminals and their environment must ensure confidentiality and integrity of respective data handled by them (e.g. confidentiality of the PACE passwords, integrity of PKI certificates, etc.), where it is necessary for a secure operation of the TOE according to the current ST.

#### OE.User\_Obligations User Obligations

The application user (e.g. travel document holder) may reveal, if necessary, his or her verification values of the PACE password to an authorized person or device who definitely act according to respective regulations and are trustworthy.

Other security objectives for Operational environment from [PP\_EAC2] are specific to travel document and are not copied here.

# 6.2.4 Supplementary security objectives for the operational environment

6.2.4.1 <u>Objectives for the operational environment of GP-SE - Package 'Cardholder Verification Method (CVM)'</u>

No Additional Objectives for the operational environment

6.2.4.2 <u>Objectives for the operational environment of GP-SE - Package 'Delegated Management (DM)'</u>

#### **OE.TOKEN-GEN**

The Token shall be generated securely by a trusted entity according to the signature algorithms defined in GlobalPlatform specifications.

Application Note: See [GP23] sections B.1, B.2, B.3, B.4, and C.4.

#### **OE.RECEIPT-VER**

The Receipt shall be verified securely by a trusted entity according to the methods defined in GlobalPlatform specifications.

Application Note: See [GP23] sections B.1, B.2, B.3, B.4, and C.5.

6.2.4.3 Objectives for the operational environment of GP-SE - Package 'DAP Verification'

#### OE.DAP\_BLOCK\_GEN

ST

The DAP Block shall be generated securely by a trusted entity that verifies the content of the Load File Data Block linked to the hash.

ST

# MultiApp V5.1: GP-SE Security Target

6.2.4.4 <u>Objectives for the operational environment of GP-SE - Package 'Mandated DAP</u> Verification'

No Additional Objectives for the operational environment

Ref: D1569436\_LITE Rev: 1.25 Page: 72 / 189

# MultiApp V5.1: GP-SE Security Target

### 6.2.4.5 Objectives for the operational environment of GP-SE - Package 'PP-Module OS Update'

The following security objectives for the operational environment shall also be considered for the present evaluation:

| OE.OS-UPDATE-EVIDENCE      | For additional code loaded pre-issuance, evaluated technical measures implemented by the TOE or audited organisational measures must ensure that the additional code (1) has been issued by the genuine OS Developer and (2) has not been altered since it was issued by the genuine OS Developer.              |
|----------------------------|---|
|                            | For additional code loaded post-issuance, the OS Developer shall provide digital evidence to the TOE that (1) he is the genuine developer of the additional code and (2) the additional code has not been modified since it was issued by the genuine OS Developer.   |
| OE.OS-UPDATE-ENCRYPTION    | For additional code loaded post-issuance, the OS Developer shall encrypt the additional code so that its confidentiality is ensured when it is transmitted to the TOE for loading and installation.   |
| OE.SECURE_ACODE_MANAGEMENT | Key management processes related to the OS Update capability shall take place in a secure and audited environment. The key generation processes shall guarantee that cryptographic keys are of sufficient quality and appropriately secured to ensure confidentiality, authenticity, and integrity of the keys. |

# MultiApp V5.1: GP-SE Security Target

### 6.3 SECURITY OBJECTIVES RATIONALE

### 6.3.1 Security objectives rationale from JCS Protection Profile - Open Configuration

|                             |       |           |             | ı          |          |                |                        |                      |         | ı             | ı        |       | 1          |            | ı              |           |          |            |                | •             |          |                   |                      | _                   |               |                 |             |                  |

Table 17: Threats, OSP, Assumptions vs Security Objectives for GP-SE Additional packages

6.3.2.3 Threats

#### 6.3.2.3.1 Confidentiality

**T.CONFID-JCS-CODE** This threat is countered by the list of properties described in the (#.VERIFICATION) security aspect. Bytecode verification ensures that each of the instructions used on the Java Card platform is used for its intended purpose and in the intended scope of accessibility. As none of those instructions enables reading a piece of code, no Java Card applet can therefore be executed to disclose a piece of code. Native applications are also harmless because of the objective (O.NATIVE), so no application can be run to disclose a piece of code.

The (#.VERIFICATION) security aspect is addressed in this ST by the objective for the environment OE.VERIFICATION. The objectives O.CARD-MANAGEMENT and OE.VERIFICATION contribute to cover this threat by controlling the access to card management functions and by checking the bytecode, respectively.

**T.CONFID-APPLI-DATA** This threat is countered by the security objective for the operational environment regarding bytecode verification (OE.VERIFICATION). It is also covered by the isolation commitments stated in the (O.FIREWALL) objective. It relies in its turn on the correct identification of applets stated in (O.SID). Moreover, as the firewall is dynamically enforced, it shall never stop operating, as stated in the (O.OPERATE) objective.

As the firewall is a software tool automating critical controls, the objective O.ALARM asks for it to provide clear warning and error messages, so that the appropriate counter-measure can be taken.

The objectives O.CARD-MANAGEMENT and OE.VERIFICATION contribute to cover this threat by controlling the access to card management functions and by checking the bytecode, respectively.

The objectives O.SCP.RECOVERY and O.SCP.SUPPORT are intended to support the O.OPERATE and O.ALARM objectives of the TOE, so they are indirectly related to the threats that these latter objectives contribute to counter. As applets may need to share some data or communicate with the CAD, cryptographic functions are required to actually protect the exchanged information (O.CIPHER, O.RNG). Remark that even if the TOE shall provide access to the appropriate TSFs, it is still the responsibility of the applets to use them. Keys, PIN's are particular cases of an application's sensitive data (the Java Card System may possess keys as well) that ask for appropriate management (O.KEY-MNGT, O.PIN-MNGT, O.TRANSACTION). If the PIN class of the Java Card API is used, the objective (O.FIREWALL) shall contribute in covering this threat by controlling the sharing of the global PIN between the applets.

Other application data that is sent to the applet as clear text arrives to the APDU buffer, which is a resource shared by all applications. The disclosure of such data is prevented by the security objective O.GLOBAL\_ARRAYS\_CONFID. An applet might share data buffer with another applet using array views without the array view security attribute ATTR\_READABLE\_VIEW. The disclosure of data of the applet creating the array view is prevented by the security object O.ARRAY\_VIEWS\_CONFID.

Finally, any attempt to read a piece of information that was previously used by an application but has been logically deleted is countered by the O.REALLOCATION objective. That objective states that any information that was formerly stored in a memory block shall be cleared before the block is reused.

**T.CONFID-JCS-DATA** This threat is covered by bytecode verification (OE.VERIFICATION) and the isolation commitments stated in the (O.FIREWALL) security objective. This latter objective also relies in its turn on the correct identification of applets stated in (O.SID). Moreover, as the firewall is dynamically enforced, it shall never stop operating, as stated in the (O.OPERATE) objective.

As the firewall is a software tool automating critical controls, the objective O.ALARM asks for it to provide clear warning and error messages, so that the appropriate counter-measure can be taken.

The objectives O.CARD-MANAGEMENT and OE.VERIFICATION contribute to cover this threat by controlling the access to card management functions and by checking the bytecode, respectively.

The objectives O.SCP.RECOVERY and O.SCP.SUPPORT are intended to support the O.OPERATE and O.ALARM objectives of the TOE, so they are indirectly related to the threats that these latter objectives contribute to counter.

#### 6.3.2.3.2 Integrity

ST

**T.INTEG-APPLI-CODE** This threat is countered by the list of properties described in the (#.VERIFICATION) security aspect. Bytecode verification ensures that each of the instructions used on the Java Card platform is used for its intended purpose and in the intended scope of accessibility. As none of these instructions enables modifying a piece of code, no Java Card applet can therefore be executed to modify a piece of code. Native applications are also harmless because of the objective (O.NATIVE), so no application can be run to modify a piece of code.

The (#.VERIFICATION) security aspect is addressed in this configuration by the objective for the environment OE.VERIFICATION.

## MultiApp V5.1: GP-SE Security Target

The objectives O.CARD-MANAGEMENT and OE.VERIFICATION contribute to cover this threat by controlling the access to card management functions and by checking the bytecode, respectively.

The objective OE.CODE-EVIDENCE contributes to cover this threat by ensuring that integrity and authenticity evidences exist for the application code loaded into the platform.

**T.INTEG-JCS-CODE** This threat is countered by the list of properties described in the (#.VERIFICATION) security aspect. Bytecode verification ensures that each of the instructions used on the Java Card platform is used for its intended purpose and in the intended scope of accessibility. As none of these instructions enables modifying a piece of code, no Java Card applet can therefore be executed to modify a piece of code. Native applications are also harmless because of the objective (O.NATIVE), so no application can be run to disclose or modify a piece of code.

The (#.VERIFICATION) security aspect is addressed in this configuration by the objective for the environment OE.VERIFICATION.

The objectives O.CARD-MANAGEMENT and OE.VERIFICATION contribute to cover this threat by controlling the access to card management functions and by checking the bytecode, respectively.

The objective OE.CODE-EVIDENCE contributes to cover this threat by ensuring that the application code loaded into the platform has not been changed after code verification, which ensures code integrity and authenticity.

**T.INTEG-APPLI-DATA** This threat is countered by bytecode verification (OE.VERIFICATION) and the isolation commitments stated in the (O.FIREWALL) objective. This latter objective also relies in its turn on the correct identification of applets stated in (O.SID). Moreover, as the firewall is dynamically enforced, it shall never stop operating, as stated in the (O.OPERATE) objective.

As the firewall is a software tool automating critical controls, the objective O.ALARM asks for it to provide clear warning and error messages, so that the appropriate counter-measure can be taken.

The objectives O.CARD-MANAGEMENT and OE.VERIFICATION contribute to cover this threat by controlling the access to card management functions and by checking the bytecode, respectively.

The objective OE.CODE-EVIDENCE contributes to cover this threat by ensuring that the application code loaded into the platform has not been changed after code verification, which ensures code integrity and authenticity. The objectives O.SCP.RECOVERY and O.SCP.SUPPORT are intended to support the O.OPERATE and O.ALARM objectives of the TOE, so they are indirectly related to the threats that these latter objectives contribute to counter.

Concerning the confidentiality and integrity of application sensitive data, as applets may need to share some data or communicate with the CAD, cryptographic functions are required to actually protect the exchanged information (O.CIPHER, O.RNG). Remark that even if the TOE shall provide access to the appropriate TSFs, it is still the responsibility of the applets to use them. Keys and PIN's are particular cases of an application's sensitive data (the Java Card System may possess keys as well) that ask for appropriate management (O.KEY-MNGT, O.PIN-MNGT, O.TRANSACTION). If the PIN class of the Java Card API is used, the objective (O.FIREWALL) is also concerned.

Other application data that is sent to the applet as clear text arrives to the APDU buffer, which is a resource shared by all applications. The integrity of the information stored in that buffer is ensured by the objective O.GLOBAL\_ARRAYS\_INTEG.

An applet might share data buffer with another applet using array views without the array view security attribute ATTR\_WRITABLE\_VIEW. The integrity of data of the applet creating the array view is ensured by the security objective O.ARRAY VIEWS INTEG.

Finally, any attempt to read a piece of information that was previously used by an application but has been logically deleted is countered by the O.REALLOCATION objective. That objective states that any information that was formerly stored in a memory block shall be cleared before the block is reused.

**T.INTEG-JCS-DATA** This threat is countered by bytecode verification (OE.VERIFICATION) and the isolation commitments stated in the (O.FIREWALL) objective. This latter objective also relies in its turn on the correct identification of applets stated in (O.SID). Moreover, as the firewall is dynamically enforced, it shall never stop operating, as stated in the (O.OPERATE) objective.

As the firewall is a software tool automating critical controls, the objective O.ALAR M asks for it to provide clear warning and error messages, so that the appropriate counter-measure can be taken.

The objectives O.CARD-MANAGEMENT and OE.VERIFICATION contribute to cover this threat by controlling the access to card management functions and by checking the bytecode, respectively.

The objective OE.CODE-EVIDENCE contributes to cover this threat by ensuring that the application code loaded into the platform has not been changed after code verification, which ensures code integrity and authenticity.

The objectives O.SCP.RECOVERY and O.SCP.SUPPORT are intended to support the O.OPERATE and O.ALARM objectives of the TOE, so they are indirectly related to the threats that these latter objectives contribute to counter.

Ref: D1569436\_LITE Rev: 1.25 Page: 78 / 189

**T.INTEG-APPLI-CODE.LOAD** This threat is countered by the security objective O.LOAD which ensures that the loading of CAP file is done securely and thus preserves the integrity of CAP file code.

The objective OE.CODE-EVIDENCE contributes to cover this threat by ensuring that the application code loaded into the platform has not been changed after code verification, which ensures code integrity and authenticity. By controlling the access to card management functions such as the installation, update or deletion of applets the objective O.CARD-MANAGEMENT contributes to cover this threat.

**T.INTEG-APPLI-DATA.LOAD** This threat is countered by the security objective O.LOAD which ensures that the loading of CAP file is done securely and thus preserves the integrity of applications data.

The objective OE.CODE-EVIDENCE contributes to cover this threat by ensuring that the application code loaded into the platform has not been changed after code verification, which ensures code integrity and authenticity. By controlling the access to card management functions such as the installation, update or deletion of applets the objective O.CARD-MANAGEMENT contributes to cover this threat.

#### 6.3.2.3.3 Identity usurpation

**T.SID.1** As impersonation is usually the result of successfully disclosing and modifying some assets, this threat is mainly countered by the objectives concerning the isolation of application data (like PINs), ensured by the (O.FIREWALL). Uniqueness of subject-identity

(O.SID) also participates to face this threat. It should be noticed that the AIDs, which are used for applet identification, are TSF data.

In this configuration, usurpation of identity resulting from a malicious installation of an applet on the card is covered by the objective O.INSTALL.

The installation parameters of an applet (like its name) are loaded into a global array that is also shared by all the applications. The disclosure of those parameters (which could be used to impersonate the applet) is countered by the objective (O.GLOBAL\_ARRAYS\_CONFID) and (O.GLOBAL\_ARRAYS\_INTEG).

The objective O.CARD-MANAGEMENT contributes, by preventing usurpation of identity resulting from a malicious installation of an applet on the card, to counter this threat.

**T.SID.2** This is covered by integrity of TSF data, subject-identification (O.SID), the firewall (O.FIREWALL) and its good working order (O.OPERATE).

The objective O.INSTALL contributes to counter this threat by ensuring that installing an applet has no effect on the state of other applets and thus can't change the TOE's attribution of privileged roles.

The objectives O.SCP.RECOVERY and O.SCP.SUPPORT are intended to support the O.OPERATE objective of the TOE, so they are indirectly related to the threats that this latter objective contributes to counter.

#### 6.3.2.3.4 Unauthorized execution

ST

**T.EXE-CODE.1** Unauthorized execution of a method is prevented by the objective OE.VERIFICATION. This threat particularly concerns the point (8) of the security aspect #VERIFICATION (access modifiers and scope of accessibility for classes, fields and methods). The O.FIREWALL objective is also concerned, because it prevents the execution of non-shareable methods of a class instance by any subject apart from the class instance owner.

**T.EXE-CODE.2** Unauthorized execution of a method fragment or arbitrary data is prevented by the objective OE.VERIFICATION. This threat particularly concerns those points of the security aspect related to control flow confinement and the validity of the method references used in the bytecodes.

**T.NATIVE** This threat is countered by O.NATIVE which ensures that a Java Card applet can only access native methods indirectly that is, through an API. OE.CAP\_FILE also covers this threat by ensuring that no CAP files containing native code shall be loaded in post-issuance. In addition to this, the bytecode verifier also prevents the program counter of an applet to jump into a piece of native code by confining the control flow to the currently executed method (OE.VERIFICATION).

#### 6.3.2.3.5 Denial of service

**T.RESOURCES** This threat is directly countered by objectives on resource-management (O.RESOURCES) for runtime purposes and good working order (O.OPERATE) in a general manner.

Consumption of resources during installation and other card management operations are covered, in case of failure, by O.INSTALL.

It should be noticed that, for what relates to CPU usage, the Java Card platform is single-threaded and it is possible for an ill-formed application (either native or not) to monopolize the CPU. However, a smart card can be physically interrupted (card removal or hardware reset) and most CADs implement a timeout policy that prevent them from being blocked should a card fails to answer. That point is out of scope of this Security Target, though.

Finally, the objectives O.SCP.RECOVERY and O.SCP.SUPPORT are intended to support the O.OPERATE and O.RESOURCES objectives of the TOE, so they are indirectly related to the threats that these latter objectives contribute to counter.

#### 6.3.2.3.6 Card management

**T.INSTALL** This threat is covered by the security objective O.INSTALL which ensures that the installation of an applet performs as expected and the security objectives O.LOAD which ensures that the loading of a CAP file into the card is safe

The objective O.CARD-MANAGEMENT controls the access to card management functions and thus contributes to cover this threat.

**T.DELETION** This threat is covered by the O.DELETION security objective which ensures that both applet and CAP file deletion perform as expected.

The objective O.CARD-MANAGEMENT controls the access to card management functions and thus contributes to cover this threat.

#### 6.3.2.3.7 Services

**T.OBJ-DELETION** This threat is covered by the O.OBJ-DELETION security objective which ensures that object deletion shall not break references to objects.

#### 6.3.2.3.8 Miscellaneous

**T.PHYSICAL** Covered by O.SCP.IC. Physical protections rely on the underlying platform and are therefore an environmental issue.

#### 6.3.2.3.9 Patch loading

ST

**T.UNAUTHORISED-TOE-CODE-UPDATE** This threat is covered by the O.SECURE\_LOAD\_ACODE security objective that ensures the authenticity and the integrity of the additional code. It ensure also that that only the allowed code will be load in a secure process.

**T.FAKE-SGNVER-KEY** This threat is covered by the O.SECURE\_LOAD\_ACODE security objective which ensures the authenticity and the integrity of the additional code to avoid loading malicious additional code.

**T.WRONG-UPDATE-STATE** This threat is covered by the O.SECURE\_AC\_ACTIVATION and O.TOE\_IDENTIFICATION security objective that ensures that the update state stay secure during all the loading process

**T.INTEG-OS-UPDATE\_LOAD** This threat is covered by the O.SECURE\_LOAD\_ACODE security objective that ensures the authenticity and the integrity of the additional code.

**T.CONFID-OS-UPDATE\_LOAD** This threat is covered by the O.CONFID-OS-UPDATE.LOAD security objective that ensures the confidentiality of the additional code when transmitted until installation.

6.3.2.3.10 Global Platform

#### T.UNAUTHORISED-CARD-MGMT is covered by:

- O.CARD-MANAGEMENT controls the access to card management functions such as the loading, installation, extradition, or deletion of applets.
- O.COMM-AUTH prevents unauthorized users from initiating a malicious card management operation.
- O.COMM-INTEGRITY protects the integrity of the card management data while it is in transit to the card.
- O.COMM-CONFIDENTIALITY prevents disclosure of encrypted data transiting to the card.
- O.APPLI-AUTH requires that each application be authenticated before loading.
- O.DOMAIN-RIGHTS restricts the modification of an AP security domain key set to the AP owning it.
- O.PRIVILEGES-MANAGEMENT enforces the Privileges assignment and management functionalities for the on-card entities ISD, SSD, and Applications.
- O.LC-MANAGEMENT enforces the Life Cycle management for the Card, ELFs, SDs, and Applications.

#### T.LIFE-CYCLE is covered by:

- O.CARD-MANAGEMENT controls the access to the card management functions of loading, installation, extradition, and deletion of applets. Attacks for modification or exploitation of the current life cycle of applications are thus rendered impractical.
- O.DOMAIN-RIGHTS restricts the use of an AP security domain key set and thereby restricts the management of applications to the affected SD and to the AP owning the key set.

#### T.COM-EXPLOIT is covered by:

- O.COMM-AUTH prevents unauthorized users from initiating a malicious card management operation.
- O.COMM-INTEGRITY protects the integrity of the card management data while it is in transit to the card.
- O.COMM-CONFIDENTIALITY prevents disclosure of encrypted data transiting to the card.

T.BRUTE-FORCE-SCP is covered by O.NO-KEY-REUSE which ensures that session keys can be used only once.

#### T.CVM-IMPERSONATE is covered by:

- O.GLOBAL-CVM restricts the modification of the security attributes of the CVM only to defined privileged applications appointed by the Card Manager.
- O.CVM-BLOCK blocks the global PIN used to authenticate the Cardholder if the maximum number of attempts has been reached.
- O.CVM-MGMT securely manages CVM objects.

#### **T.CVM-UPDATE** is covered by:

ST

- O.CVM-BLOCK blocks the global PIN used to authenticate the Cardholder if the maximum number of attempts has been reached.
- O.CVM-MGMT securely manages CVM objects

#### **T.BRUTE-FORCE-CVM** is covered by:

- O.CVM-BLOCK blocks the global PIN used to authenticate the Cardholder if the maximum number of attempts has been reached.
- O.CVM-MGMT securely manages CVM objects

**T.RECEIPT** is covered by O.RECEIPT which generates non repudiable receipts of the completion of card management operations.

**T.TOKEN** is covered by O.TOKEN which verifies tokens during the processing of card management operations.

6.3.2.4 Organizational Security Policies

**OSP.VERIFICATION** This policy is upheld by the security objective of the environment OE.VERIFICATION which guarantees that all the bytecodes shall be verified at least once, before the loading, before the installation or before the execution in order to ensure that each bytecode is valid at execution time.

This policy is also upheld by the security objective of the environment OE.CODE-EVIDENCE which ensures that evidences exist that the application code has been verified and not changed after verification, and by the security objective for the TOE O.LOAD which shall ensure that the loading of a CAP file into the card is safe.

### 6.3.2.5 Global Platform Organizational Security Policies

**OSP.AID-MANAGEMENT** is directly enforced by the security objective for the operational environment of the TOE OE.AID-MANAGEMENT.

**OSP.LOADING** is enforced by the security objective for the operational environment of the TOE OE.LOADING.

**OSP.SERVERS** is enforced by the security objective for the operational environment of the TOE OE.SERVERS.

OSP.APSD-KEYS is enforced by the security objective for the operational environment of the TOE OE.AP-KEYS.

OSP.ISD-KEYS is enforced by the security objective for the operational environment of the TOE OE.ISD-KEYS.

**OSP.KEY-GENERATION** is enforced by the security objective for the operational environment of the TOE OE.KEY-GENERATION.

OSP.CASD-KEYS is enforced by the security objective for the operational environment of the TOE OE.CA-KEYS.

**OSP.KEY-CHANGE** is enforced by the security objective for the operational environment of the TOE OE.KEY-CHANGE.

OSP.SECURITY-DOMAINS is enforced by the security objective for the TOE O.SECURITY-DOMAINS.

**OSP.APPLICATIONS** is enforced by the security objective for the operational environment of the TOE OE.APPLICATIONS.

OSP.TOKEN-GEN is enforced by the security objective for the operational environment of the TOE OE.TOKEN-GEN.

**OSP.RECEIPT-VER** is enforced by the security objective for the operational environment of the TOE OE.RECEIPTVER.

**OSP.DAP\_BLOCK\_GEN** is enforced by the security objective for the operational environment of the TOE OE.DAP BLOCK GEN.

**OSP.ADDITIONAL\_CODE\_ENCRYPTION** is enforced by the TOE security objective of the environment OE.OS-UPDATE-ENCRYPTION which ensure the confidentiality of the additional code

**OSP.ADDITIONAL\_CODE\_SIGNING** is enforced by the TOE security objective of the environment O.SECURE\_LOAD\_ACODE which ensure the integrity of the additional code

**OSP.ATOMIC\_ACTIVATION** is enforced by the TOE security objective of the environment O.SECURE\_AC\_ACTIVATION which ensure the atomicity of the activation of the additional code

**OSP.TOE\_IDENTIFICATION** is enforced by the TOE security objective of the environment O.TOE\_IDENTIFICATION which ensure the identification of the additional code

#### 6.3.2.6 Additional Organizational Security Policies

ST

**OSP.SpecificAPI** This OSP is enforced by the TOE security objective O.SpecificAPI.

**OSP.RNG** This OSP is enforced by the TOE security objective O.RNG.

#### 6.3.2.7 Assumptions

**A.CAP\_FILE** This assumption is upheld by the security objective for the operational environment **OE.CAP\_FILE** which ensures that no CAP file loaded post-issuance shall contain native methods.

**A.VERIFICATION** This assumption is upheld by the security objective on the operational environment OE.VERIFICATION which guarantees that all the bytecodes shall be verified at least once, before the loading, before the installation or before the execution in order to ensure that each bytecode is valid at execution time.

This assumption is also upheld by the security objective of the environment OE.CODE-EVIDENCE which ensures that evidences exist that the application code has been verified and not changed after verification.

#### 6.3.2.8 Global Platform Assumptions

A.ISSUER is directly upheld by OE.ISSUER.

A.ADMIN is directly upheld by OE.ADMIN.

**A.APPS-PROVIDER** is directly upheld by OE.APPS-PROVIDER.

A.VERIFICATION-AUTHORITY is directly upheld by OE.VERIFICATION-AUTHORITY.

**A.KEY-ESCROW** This assumption is directly upheld by OE.KEY-ESCROW.

A.PERSONALISER This assumption is directly upheld by OE.PERSONALISER.

**A.CONTROLLING-AUTHORITY** is directly upheld by OE.CONTROLLING-AUTHORITY.

**A.PRODUCTION** is directly upheld by OE.PRODUCTION.

A.SCP-SUPP is directly upheld by OE.SCP-SUPP.

ST

**A.KEYS-PROT** is directly upheld by OE.KEYS-PROT.

**A.OS-UPDATE-EVIDENCE** This assumption is upheld by the security objective on the operational environment OE.OS-UPDATE-EVIDENCE that guarantees that the additional code has been issued by the genuine OS Developer, has not been altered since it was issued by the genuine OS Developer.

**A.SECURE\_ACODE\_MANAGEMENT** This assumption is upheld by the security objective on the operational environment OE.SECURE\_ACODE\_MANAGEMENT that guarantees that cryptographic keys are of sufficient quality and appropriately secured to ensure confidentiality, authenticity and integrity of the keys.

### 6.3.3 Security objectives rationale for PACE Module

#### 6.3.3.1 Threats

The following table provides an overview for security objectives coverage.

|                         | OT.AC_Pers | OT.Data_Integrity | OT.Data_Authenticity | OT.Data_Confidentiality | OT.Prot_Abuse | OT.Prot_Inf_Leak | OT.Identification | OT.Prot_Phys-Tamper | OT.Prot_Malfuntion | OE.Prot_Logical_Data | OE.Personalisation | OE.Terminal | OE.User_Obligations |
|-------------------------|------------|-------------------|----------------------|-------------------------|---------------|------------------|-------------------|---------------------|--------------------|----------------------|--------------------|-------------|---------------------|
| T.Skimming <sup>2</sup> |            | Χ                 | Χ                    | Χ                       |               |                  |                   |                     |                    |                      |                    |             | Χ                   |
| T.Eavesdropping         |            |                   |                      | Χ                       |               |                  |                   |                     |                    |                      |                    |             |                     |
| T.Abuse-Func            |            |                   |                      |                         | Χ             |                  |                   |                     |                    |                      |                    |             |                     |
| T.Information_Leakage   |            |                   |                      |                         |               | Χ                |                   |                     |                    |                      |                    |             |                     |
| T.Phys-Tamper           |            |                   |                      |                         |               |                  |                   | Χ                   |                    |                      |                    |             |                     |
| T.Malfunction           |            |                   |                      |                         |               |                  |                   |                     | Χ                  |                      |                    |             |                     |
| T.Forgery               | Х          | Х                 | Χ                    |                         | Χ             |                  |                   | Χ                   |                    |                      | Χ                  | Χ           |                     |

Table 18: Threats vs Security Objectives for PACE Module

The threat **T.Skimming** addresses accessing the User Data (stored on the TOE or transferred between the TOE and the terminal) using the TOE's contactless/contact interface. This threat is countered by the security objectives **OT.Data\_Integrity**, **OT.Data\_Authenticity** and **OT.Data\_Confidentiality** through the PACE authentication. The objective **OE.User\_Obligations** ensures that a PACE session can only be established either by the application user itself (e.g. travel document holder for MRTD) or by an authorised person or device, and, hence, cannot be captured by an attacker.

The threat **T.Eavesdropping** addresses listening to the communication between the TOE and a rightful terminal in order to gain the User Data transferred there. This threat is countered by the security objective **OT.Data\_Confidentiality** through a trusted channel based on the PACE authentication.

The threat **T.Forgery** addresses the fraudulent, complete or partial alteration of the User Data or/and TSF-data stored on the TOE or/and exchanged between the TOE and the terminal. The security objective **OT.AC\_Pers** requires the TOE to limit the write access for the TOE and applicative data to the trustworthy Personalisation Agent (cf. **OE.Personalisation**). The TOE will protect the integrity and authenticity of the stored and exchanged User Data or/and TSF-data as aimed by the security objectives **OT.Data\_Integrity** and **OT.Data\_Authenticity**, respectively. The objectives **OT.Prot\_Phys-Tamper** and **OT.Prot\_Abuse-Func** contribute to protecting integrity of the User Data or/and TSF-data stored on the TOE. A terminal operator operating his terminals according to **OE.Terminal** to contribute to secure exchange between the TOE and the terminal.

The threat **T.Abuse-Func** addresses attacks of misusing TOE's functionality to manipulate or to disclosure the stored User- or TSF-data as well as to disable or to bypass the soft-coded security functionality. The security objective **OT.Prot\_Abuse-Func** ensures that the usage of functions having not to be used in the operational phase is effectively prevented.

The threats **T.Information\_Leakage**, **T.Phys-Tamper** and **T.Malfunction** are typical for integrated circuits like smart cards under direct attack with high attack potential. The protection of the TOE against these threats is obviously addressed by the directly related security objectives **OT.Prot\_Inf\_Leak**, **OT.Prot\_Phys-Tamper** and **OT.Prot\_Malfunction**, respectively.

ST Ref: D1569436\_LITE Rev: 1.25

<sup>&</sup>lt;sup>2</sup> Threats and assumptions included from the claimed PACE-PP [7] are marked *in italic letters*. They are listed for the complete overview of threats and assumptions.

### 6.3.3.2 Organizational Security Policies and Assumptions

|                   | OT.AC_Pers | OT.Data_Integrity | OT.Data_Authenticity | OT.Data_Confidentiality | OT.Prot_Abuse | OT.Prot_Inf_Leak | OT.Identification | OT.Prot_Phys-Tamper | OT.Prot_Malfuntion | OE.Prot_Logical_Data | OE.Personalisation | OE.Terminal | OE.User_Obligations |
|-------------------|------------|-------------------|----------------------|-------------------------|---------------|------------------|-------------------|---------------------|--------------------|----------------------|--------------------|-------------|---------------------|
| P.Personalisation | Χ          |                   |                      |                         |               |                  | Χ                 |                     |                    |                      | Χ                  |             |                     |
| P.Manufact        |            |                   |                      |                         |               |                  | Χ                 |                     |                    |                      |                    |             |                     |
| P.Pre-Operational | Χ          |                   |                      |                         |               |                  | Χ                 |                     |                    |                      | Χ                  |             |                     |
| P.Terminal        |            |                   |                      |                         |               |                  |                   |                     |                    |                      |                    | Χ           |                     |
| A.Insp_Sys        |            |                   |                      |                         |               |                  |                   |                     |                    | Χ                    |                    |             |                     |

Table 19: OSP and Assumptions vs Security Objectives for PACE Module

The OSP **P.Personalisation** addresses the (i) the enrolment of the logical travel document by the Personalisation Agent as described in the security objective for the TOE environment **OE.Personalisation**, and (ii) the access control for the user data and TSF data as described by the security objective **OT.AC\_Pers.** Note the manufacturer equips the TOE with the Personalisation Agent Key(s) according to **OT.Identification** "Identification and Authentication of the TOE".

The OSP **P.Manufact** requires a unique identification of the IC by means of the Initialization Data and the writing of the Pre-personalisation Data as being fulfilled by **OT.Identification**.

The OSP **P.Pre-Operational** is enforced by the following security objectives: **OT.Identification** is affine to the OSP's property 'traceability before the operational phase'; **OT.AC\_Pers** and **OE.Personalisation** together enforce the OSP's properties 'correctness of the User- and the TSF-data stored' and 'authorisation of Personalisation Agents'.

The OSP **P.Terminal** "Abilities and trustworthiness of terminals" is countered by the security objective **OE.Terminal** enforces the terminals to perform the terminal part of the PACE protocol.

**A.Insp\_Sys is covered by OE.Prot\_Logical\_Data** requiring the Inspection System to protect the TOE and application data (e.g. the logical travel document data) during the transmission and the internal handling.

#### 6.3.3.3 Compatibility between objectives of the TOE and objectives of [AQU-IC]

#### 6.3.3.3.1 Compatibility between objectives for the TOE

O.SID, O.OPERATE, O.RESOURCES, O.FIREWALL, O.NATIVE, O.REALLOCATION, O.GLOBAL\_ARRAYS\_CONFID, O.GLOBAL\_ARRAYS\_INTEG, O.ARRAY\_VIEWS\_CONFID, O. ARRAY\_VIEWS\_INTEG, O.ALARM; O.TRANSACTION, O.PIN-MNGT, O.KEY-MNGT, O.OBJ-DELETION, O.INSTALL, O.LOAD, O.DELETION, O.CIPHER are objectives specific to the Java Card platform and they do no conflict with the objectives of [AQU-IC].

O.CARD-MANAGEMENT, O.SpecificAPI, O.SECURE\_LOAD\_ACODE, O.SECURE\_AC\_ACTIVATION, O.TOE\_IDENTIFICATION and O.CONFID-OS-UPDATE.LOAD are objectives added to this platform it does no conflict with the objectives of [AQU-IC].

O.RNG added to this platform is included in the following objectives of [AQU-IC]: O.RND

O.SCP.IC is included in the following objectives of [AQU-IC]: O.Phys-Manipulation, O.Phys-Probing, O.Malfunction O.Leak-Inherent O.Leak-Forced O.Abuse-Func.

O.SCP.RECOVERY is included in the following objectives of [AQU-IC]: O.Leak-Inherent, O.Leak-Forced, O.Malfunction O.SCP.SUPPORT is included in the following objectives of [AQU-IC]: O.Mem-Access, O.Prot\_TSF\_Confidentiality

We can therefore conclude that the objectives for the TOE and [AQU-IC] are consistent.

6.3.3.3.2 Compatibility between objectives for the environment

OE.Personalisation OE.VERIFICATION, OE.CODE-EVIDENCE and OE.CAP\_FILE are objectives specific to the Java Card platform and they do no conflict with the objectives of [AQU-IC].

OE.OS-UPDATE-EVIDENCE, OE.OS-UPDATE-ENCRYPTION and OE.SECURE\_ACODE\_MANAGEMENT are objectives specific to the GP-SE platform and they do no conflict with the objectives of [AQU-IC].

We can therefore conclude that the objectives for the environment of TOE and the objectives for the environment of [AQU-IC] are consistent.

### 6.3.3.4 Compatibility between objectives of PACE Module and [AQU-IC]

#### 6.3.3.4.1 Compatibility between objectives for the TOE

OT\_AC\_Pers is specific to the current document and it does no conflict with the objectives of [AQU-IC].

OT.Data\_Confidentiality; OT.Data\_Integrity and OT.Data\_Authenticity are linked in O.Phys-Manipulation and O.RNG used for cryptographic operations.

OT.Identification is linked to O.Identification.

OT.Prot Abuse-Func is linked in O.Abuse-Func.

OT.Prot Inf Leak is linked in O.Leak-Inherent and O.Leak-Forced

OT.Prot Phys-Tamper is linked in O.Phys-Manipulation.

OT.Prot Malfunction is linked in O.Malfunction.

ST

We can therefore conclude that the objectives for the TOE of PACE module and [ST-IC] are consistent.

#### 6.3.3.4.2 Compatibility between objectives for the environment

| [AQU-IC] Objectives  | IrOE | CfPOE                   | SgOE | Description                                       |
|--|------|-------------------------|------|---|
| OE.Resp-Appl   |      | X<br>OE.Personalization |      | Treatment of User Data of the Composite TOE       |
| OE.Process-Sec-IC  |      | X<br>OE.Personalization |      | Protection during composite product manufacturing |
| OE.Lim_Block_Loader<br>(Loader dedicated for usage<br>in secured environment only)                           | X    |                         |      | Limitation of capability and blocking the Loader  |
| OE.Loader_Usage<br>(Loader dedicated for usage<br>by authorized users only)                                  | Х    |                         |      | Secure communication and usage of the Loader      |
| OE.TOE_Auth (applicable, if Flash Loader active and TOE is ordered with configuration option EA unavailable) | Х    |                         |      | External entities authenticating of the TOE       |

### Table 20: Compatibility between environment objectives of PACE Module and [AQU-IC]

OE.Prot\_Logical\_Data, OE.Terminal, OE.User\_Obligations, are specific to this TOE and they do no conflict with the objectives of [AQU-IC].

We can therefore conclude that the objectives for the environment of PACE module and [AQU-IC] are consistent.

### 7 EXTENDED COMPONENTS DEFINITION

#### 7.1 EXTENDED COMPONENTS DEFINITION FROM PP JCS AND PP GP

### 7.1.1 Definition of the Family FCS\_RNG

To define the IT security functional requirements of the TOE a sensitive family (FCS\_RNG) of the Class FCS (cryptographic support) is defined here. This family describes the functional requirements for random number generation used for cryptographic purposes.

#### FCS RNG Generation of random numbers

Family behaviour

This family defines quality requirements for the generation of random numbers which are intended to be used for cryptographic purposes.

Component levelling:

FCS\_RNG Generation of random numbers

FCS\_RNG.1 Generation of random numbers requires that

random numbers meet a defined quality metric.

Management: FCS\_RNG.1

There are no management activities foreseen.

Audit: FCS\_RNG.1

There are no actions defined to be auditable.

#### FCS RNG.1 Random number generation

Hierarchical to: No other components
Dependencies: No dependencies

FCS\_RNG.1.1 The TSF shall provide a [selection: physical, non-physical true, deterministic, hybrid

physical, hybrid deterministic] random number generator [selection: DRG.2, DRG.3, DRG.4, PTG.2, PTG.3, NTG.1] [AIS20] [AIS31] that implements: [assignment: list of

security capabilities].

FCS\_RNG.1.2 The TSF shall provide random numbers that meet [assignment: a defined quality metric].

#### Refinement for AIS31 DRG4 compliancy:

The TSF shall provide a hybrid deterministic random number generator that implements:

(DRG.4.1) The internal state of the RNG shall use PTRNG of class PTG.2 as random source.

(DRG.4.2) The RNG provides forward secrecy.

(DRG.4.3) The RNG provides backward secrecy even if the current internal state is known.

(DRG.4.4) The RNG provides enhanced forward secrecy after calling the re-seed function that acts as a refreshing done at each random generation.

(DRG.4.5) The internal state of the RNG is seeded by an internal entropy source, PTRNG of class PTG.2.

The TSF shall provide random numbers that meet:

ST

(DRG.4.6) The RNG generates output for which  $2^{35}$  strings of bit length 128 are mutually different with probability equal to  $(1 - 1/2^{58})$ .

(DRG.4.7) Statistical test suites cannot practically distinguish the random numbers from output sequences of an ideal RNG. The random numbers must pass test procedure A.

#### 7.2 EXTENDED COMPONENTS DEFINITION FROM PACE MODULE

This security target uses components defined as extensions to CC part 2. Some of these components are defined in protection profile [PP-IC-0084], others are defined in the protection profile [PP-EAC2].

#### 7.2.1 Definition of the Family FMT\_LIM

The family FMT\_LIM describes the functional requirements for the Test Features of the TOE. The new functional requirements were defined in the class FMT because this class addresses the management of functions of the TSF. The examples of the technical mechanism used in the TOE show that no other class is appropriate to address the specific issues of preventing the abuse of functions by limiting the capabilities of the functions and by limiting their availability.

The family "Limited capabilities and availability (FMT LIM)" is specified as follows.

#### FMT\_LIM Limited capabilities and availability

Family behavior

This family defines requirements that limit the capabilities and availability of functions in a combined manner. Note that FDP\_ACF restricts the access to functions whereas the Limited capability of this family requires the functions themselves to be designed in a specific manner.

FMT\_LIM Limited capabilities and availability 2

Component leveling:

FMT\_LIM.1 Limited capabilities requires that the TSF is built to provide only the capabilities (perform

action, gather information) necessary for its genuine purpose.

FMT LIM.2 Limited availability requires that the TSF restrict the use of functions (refer to Limited

capabilities (FMT LIM.1)). This can be achieved, for instance, by removing or by disabling

functions in a specific phase of the TOE's life-cycle.

Management: FMT\_LIM.1, FMT\_LIM.2

There are no management activities foreseen.

Audit: FMT\_LIM.1, FMT\_LIM.2

There are no actions defined to be auditable.

The TOE Functional Requirement "Limited capabilities (FMT\_LIM.1)" is specified as follows.

#### FMT\_LIM.1 Limited capabilities

Hierarchical to: No other components

Dependencies: FMT\_LIM.2 Limited availability.

FMT\_LIM.1.1 The TSF shall be designed in a manner that limits their capabilities so that in conjunction with "Limited availability (FMT\_LIM.2)" the following policy is enforced [assignment: Limited capability and availability policy].

The TOE Functional Requirement "Limited availability (FMT\_LIM.2)" is specified as follows.

#### FMT\_LIM.2 Limited availability

ST

Hierarchical to: No other components

Dependencies: FMT LIM.1 Limited capabilities.

FMT\_LIM.2.1 The TSF shall be designed in a manner that limits their availability so that in conjunction

with "Limited capabilities (FMT\_LIM.1)" the following policy is enforced [assignment: Limited

capability and availability policy].

**Application note:** The functional requirements FMT\_LIM.1 and FMT\_LIM.2 assume that there are two types of mechanisms (limited capabilities and limited availability) which together shall provide protection in order to enforce the policy. This also allows that

(i) the TSF is provided without restrictions in the product in its user environment but its capabilities are so limited that the policy is enforced

or conversely

(ii) the TSF is designed with test and support functionality that is removed from, or disabled in, the product prior to the Operational Use Phase.

The combination of both requirements shall enforce the policy.

#### 7.2.2 Definition of the Family FPT\_EMS

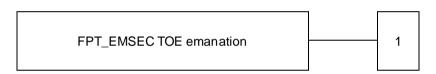

The sensitive family FPT\_EMS (TOE Emanation) of the Class FPT (Protection of the TSF) is defined here to describe the IT security functional requirements of the TOE. The TOE shall prevent attacks against the TOE and other secret data where the attack is based on external observable physical phenomena of the TOE. Examples of such attacks are evaluation of TOE's electromagnetic radiation, simple power analysis (SPA), differential power analysis (DPA), timing attacks, etc. This family describes the functional requirements for the limitation of intelligible emanations which are not directly addressed by any other component of CC part 2 [CC-2].

The family "TOE Emanation (FPT EMS)" is specified as follows.

Family behaviour

This family defines requirements to mitigate intelligible emanations.

Component levelling:

FPT EMS.1 TOE emanation has two constituents:

FPT\_EMS.1.1 Limit of Emissions requires to not emit intelligible emissions enabling access to TSF data or user data.

FPT\_EMS.1.2 Interface Emanation requires to not emit interface emanation enabling access to TSF data or user data.

Management: FPT EMS.1

There are no management activities foreseen.

Audit: FPT EMS.1

There are no actions defined to be auditable.

#### **FPT\_EMS.1 TOE Emanation**

ST

Hierarchical to: No other components

Dependencies: No dependencies.

FPT\_EMS.1.1 The TOE shall not emit [assignment: types of emissions] in excess of [assignment: specified

limits] enabling access to [assignment: list of types of TSF data] and [assignment: list of

types of user data].

FPT\_EMS.1.2 The TSF shall ensure [assignment: type of users] are unable to use the following interface

[assignment: type of connection] to gain access to [assignment: list of types of TSF data]

and [assignment: list of types of user data].

### 8 SECURITY REQUIREMENTS

ST

#### **8.1 SECURITY FUNCTIONAL REQUIREMENTS**

For this section, a presentation choice has been selected. Each SFR may present a table with different type of algorithms treated. For each case, there is no distinction regarding the technical objectives fulfilled by each row on the table (thus algorithm family). The technical objectives are the same disregarding this differentiation.

### 8.1.1 Security Functional Requirements from PP Java Card System - Open configuration

This section states the security functional requirements for the Java Card System – Open configuration.

| Group                                 | Description  |
|---------------------------------------|--|
| Core with Logical Channels (CoreG_LC) | The CoreG_LC contains the requirements concerning the runtime environment of the Java Card System implementing logical channels. This includes the firewall policy and the requirements related to the Java Card API. Logical channels are a Java Card specification version 2.2 feature. This group is the union of requirements from the Core (CoreG) and the Logical channels (LCG) groups defined in [PP-JCS-Open].  (cf Java Card System Protection Profile Collection [PP JCS]). |
| Installation (InstG)                  | The InstG contains the security requirements concerning the installation of post-<br>issuance applications. It does not address card management issues in the broad<br>sense, but only those security aspects of the installation procedure that are related<br>to applet execution.   |
| Applet deletion (ADELG)               | The ADELG contains the security requirements for erasing installed applets from the card, a feature introduced in Java Card specification version 2.2.   |
| Object deletion<br>(ODELG)            | The ODELG contains the security requirements for the object deletion capability. This provides a safe memory recovering mechanism. This is a Java Card specification version 2.2 feature.  |
| Secure carrier<br>(CarG)              | The CarG group contains minimal requirements for secure downloading of applications on the card. This group contains the security requirements for preventing, in those configurations that do not support on-card static or dynamic bytecodes verification, the installation of a package that has not been bytecode verified, or that has been modified after bytecode verification.   |
| Smart Card Platform (SCPG)            | The SCPG group contains the security requirements for the smart card platform, that is, operating system and chip that the Java Card System is implemented upon.   |
| Card Manager (CMGRG)                  | The CMGRG group contains the security requirements for the card manager.   |
| Additional SFR (ASFR)                 | The ASFR group contains security requirements related to specific API and to random generation   |

The SFRs refer to all potentially applicable subjects, objects, information, operations and security attributes.

Subjects are active components of the TOE that (essentially) act on the behalf of users. The users of the TOE include people or institutions (like the applet developer, the card issuer, the verification authority), hardware (like the CAD where the card is inserted or the PCD) and software components (like the application packages installed on the card). Some of the users may just be aliases for other users. For instance, the verification authority in charge of the bytecode verification of the applications may be just an alias for the card issuer. Subjects (prefixed with an "S") are described in the following table:

| Subject     | Description  |
|-------------|--|
| S.ADEL      | The applet deletion manager which also acts on behalf of the card issuer. It   |
|             | may be an applet ([JCRE22], §11), but its role asks anyway for a specific  |
|             | treatment from the security viewpoint.   |
| S.APPLET    | Any applet instance.   |
| S.BCV       | The bytecode verifier (BCV), which acts on behalf of the verification authority  |
|             | who is in charge of the bytecode verification of the CAP files.  |
| S.CAD       | The CAD represents off-card entity that communicates with the S.INSTALLER.   |
| S.INSTALLER | The installer is the on-card entity which acts on behalf of the card issuer. This  |
|             | subject is involved in the loading of CAP files and installation of applets.   |
| S.JCRE      | The runtime environment on which Java programs in a smart card are executed.   |
| S.JCVM      | The bytecode interpreter that enforces the firewall at runtime.  |
| S.LOCAL     | Operand stack of a JCVM frame, or local variable of a JCVM frame containing  |
|             | an object or an array of references.   |
| S.MEMBER    | Any object's field, static field or array position.  |
| S.CAP_FILE  | A CAP file may contain multiple Java language packages. A package is a namespace within the Java programming language that may contain classes and interfaces. A CAP file may contain packages that define either a user library, or one or several applets. A CAP file compliant with Java Card Specifications version 3.1 may contain multiple Java language packages. An EXTENDED CAP file as specified in Java Card Specifications version 3.1 may contain only applet packages, only library packages or a combination of library packages. A COMPACT CAP file as specified in Java Card Specifications version 3.1 or CAP files compliant to previous versions of Java Card Specification, MUST contain only a single package representing a library or one or more applets. |
| S.SD        | A GlobalPlatform SD representing an off-card entity on the card. This entity can be the Issuer, an Application Provider, the Controlling Authority, or the Validation Authority.   |
| S.OPEN      | It represents the GlobalPlatform Environment (OPEN) on the card. The main responsibility of the S.OPEN is to provide an API to applications, command dispatch, Application selection, (optional) logical channel management, Card Content management, memory management, and Life Cycle management.  |
|             | S.ADEL and S.INSTALLER are parts of S.OPEN.  |

# MultiApp V5.1: GP-SE Security Target

Objects (prefixed with an "O") are described in the following table:

| Object          | Description   |
|-----------------|---|
| O.APPLET        | Any installed applet, its code and data.  |
| O.CODE_CAP_FILE | The code of a CAP file, including all linking information. On the Java Card platform, a CAP file is the installation unit.                            |
| O.JAVAOBJECT    | Java class instance or array. It should be noticed that KEYS, PIN, arrays and applet instances are specific objects in the Java programming language. |

Information (prefixed with an "I") is described in the following table:

| Information | Description   |
|-------------|---|
| I.APDU      | Any APDU sent to or from the card through the communication channel.  |
| I.DATA      | JCVM Reference Data: objective addresses of APDU buffer, JCRE-owned instances of APDU class and byte array for install method |

Security attributes linked to these subjects, objects and information are described in the following table with their values (used in enforcing the SFRs):

| Security attribute       | Description/Value  |
|--------------------------|--|
| Active Applets           | The set of the active applets' AIDs. An active applet is an applet that is selected on at least one of the logical channels.   |
| Applet Selection Status  | "Selected" or "Deselected"   |
| Applet's version number  | The version number of an applet indicated in the export file   |
| Class                    | Identifies the implementation class of the remote object.  |
| Context                  | CAP file AID, or "Java Card RE"  |
| Currently Active Context | CAP file AID, or "Java Card RE"  |
| Dependent package AID    | Allows the retrieval of the package AID and Applet's version number ([JCVM3], §4.5.2).   |
| ExportedInfo             | Boolean (Indicates whether the remote object is exportable or not).  |
| Identifier               | The Identifier of a remote object or method is a number that uniquely identifies a remote object or method, respectively.  |
| LC Selection Status      | Multiselectable, Non-multiselectable or "None".  |
| LifeTime                 | CLEAR_ON_DESELECT or PERSISTENT (*).   |
| Owner                    | The Owner of an object is either the applet instance that created the object or the CAP file (library) where it has been defined (these latter objects can only be arrays that initialize static fields of the CAP file). The owner of a remote object is the applet instance that created the object. |
| CAP File AID             | The AID of a CAP file.   |
| Package AID              | The AID of each package indicated in the export file   |
| Registered applets       | The set of AID of the applet instance registered on the card   |
| Resident CAP files       | The set of AIDs of the CAP files already loaded on the card.   |
| Selected Applet Context  | CAP File AID, or "None"  |
| Sharing                  | Standards, SIO, Arraw view, Java Card RE entry point, or global array  |
| Static References        | Static fields of a CAP file may contain references to objects. The Static References attribute records those references.   |

<sup>(\*)</sup> Transient objects of type CLEAR\_ON\_RESET behave like persistent objects in that they can be accessed only when the Currently Active Context is the object's context.

# MultiApp V5.1: GP-SE Security Target

Operations (prefixed with "OP") are described in the following table. Each operation has a specific number of parameters given between brackets, among which there is the "accessed object", the first one, when applicable. Parameters may be seen as security attributes that are under the control of the subject performing the operation.

| Operation   | Description   |  |  |
|---|---|--|--|
| OP.ARRAY_ACCESS(O.JAVAOBJECT, field)  | Read/Write an array component.  |  |  |
| OP.ARRAY_LENGTH (O.JAVAOBJECT, field)   | Get length of an array component.   |  |  |
| OP.ARRAY_AASTORE(O.JAVAOBJECT, field)   | Store into reference array component  |  |  |
| OP.ARRAY_T_ALOAD(O.JAVAOBJECT, field)   | Read from an array component  |  |  |
| OP.ARRAY_T_ASTORE(O.JAVAOBJECT, field)  | Write to an array component   |  |  |
| OP.CREATE(Sharing, LifeTime) (*)  | Creation of an object (new or makeTransient or createArrawView call).   |  |  |
| OP.DELETE_APPLET(O.APPLET,)  Delete an installed applet and its objects, logically or physically. |   |  |  |
| OP.DELETE_CAP_FILE(O.CODE_CAP_FILE,)  | Delete a CAP file, either logically or physically.  |  |  |
| OP.DELETE_CAP_FILE_APPLET(O.CODE_CAP_FILE,)   | Delete a CAP file and its installed applets, either logically or physically.  |  |  |
| OP.INSTANCE_FIELD(O.JAVAOBJECT, field)  | Read/Write a field of an instance of a class in the Java programming language   |  |  |
| OP.INVK_VIRTUAL(O.JAVAOBJECT, method, arg1,)  | d, arg1,) Invoke a virtual method (either on a class instance or an array object)   |  |  |
| OP.INVK_INTERFACE(O.JAVAOBJECT, method, arg1,)  | Invoke an interface method.   |  |  |
| OP.JAVA()   | Any access in the sense of [JCRE3], §6.2.8. It stands for one of the operations OP.ARRAY_ACCESS, OP.INSTANCE_FIELD, OP.INVK_VIRTUAL, OP.INVK_INTERFACE, OP.THROW, OP.TYPE_ACCESS. |  |  |
| OP.PUT(S1,S2,I)   | Transfer a piece of information I from S1 to S2.  |  |  |
|   |   |  |  |
| OP.THROW(O.JAVAOBJECT)  | Throwing of an object (throw, see [JCRE3],§6.2.8.7)   |  |  |
| OP.TYPE_ACCESS(O.JAVAOBJECT, class)   | Invoke checkcast or instanceof on an object in order to access to classes (standard or shareable interfaces objects).   |  |  |

<sup>(\*)</sup> For this operation, there is no accessed object. This rule enforces that shareable transient objects are not allowed. For instance, during the creation of an object, the JavaCardClass attribute's value is chosen by the creator.

8.1.1.1 CoreG\_LC Security Functional Requirements

This group is focused on the main security policy of the Java Card System, known as the firewall. This policy essentially concerns the security of installed applets. The policy focuses on the execution of bytecodes.

8.1.1.1.1 Firewall Policy

#### FDP\_ACC.2/FIREWALL Complete access control

FDP\_ACC.2.1/FIREWALL The TSF shall enforce the FIREWALL access control SFP on S.CAP\_FILE, S.JCRE, S.JCVM, O.JAVAOBJECT and all operations among subjects and objects covered by the SFP.

Refinement:

The operations involved in the policy are:

- OP.CREATE,
- OP.INVK INTERFACE,
- OP.INVK\_VIRTUAL,
- OP.JAVA,
- OP.THROW,
- · OP.TYPE ACCESS.
- OP.ARRAY\_LENGTH
- OP.ARRAY\_T\_ALOAD
- OP.ARRAY T ASTORE
- OP.ARRAY AASTORE

**FDP\_ACC.2.2/FIREWALL** The TSF shall ensure that all operations between any subject controlled by the TSF and any object controlled by the TSF are covered by an access control SFP. Application note:

Accessing array's components of a static array, and more generally fields and methods of static objects, is an access to the corresponding O.JAVAOBJECT.

#### FDP ACF.1/FIREWALL Security attribute based access control

FDP\_ACF.1.1/FIREWALL The TSF shall enforce the FIREWALL access control SFP to objects based on the following:

| Subject/Object | Attributes                              |
|----------------|---|
| S.CAP_FILE     | LC Applet Selection Status              |
| S.JCVM         | ActiveApplets, Currently Active Context |
| S.JCRE         | Selected Applet Context                 |
| O.JAVAOBJECT   | Sharing, Context, LifeTime              |

**FDP\_ACF.1.2/FIREWALL** The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:

- R.JAVA.1 ([JCRE3]§6.2.8) An S.CAP\_FILE may freely perform any of OP.ARRAY\_ACCESS, OP.INSTANCE\_FIELD, OP.INVK\_VIRTUAL, OP.INVK\_INTERFACE, OP.THROW or OP.TYPE\_ACCESS upon any O.JAVAOBJECT whose Sharing attribute has value "JCRE entry point" or "global array".
- R.JAVA.2 ([JCRE3]§6.2.8) An S.CAP FILE may freely perform any of OP.ARRAY ACCESS,
- OP.INSTANCE\_FIELD, OP.INVK\_VIRTUAL, OP.INVK\_INTERFACE or OP.THROW upon any O.JAVAOBJECT whose Sharing attribute has value "Standard" and whose Lifetime attribute has value "PERSISTENT" only if O.JAVAOBJECT's Context attribute has the same value as the active context.
- R.JAVA.3 ([JCRE3]§6.2.8.10) An S.CAP\_FILE may perform OP.TYPE\_ACCESS upon an O.JAVAOBJECT with Context attribute different from the currently active context, whose Sharing attribute has value "SIO" only if O.JAVAOBJECT is being cast into (checkcast) or is being verified as being an instance of (instanceof) an interface that extends the Shareable interface.
- R.JAVA.4 ([JCRE3], §6.2.8.6,) An S.CAP\_FILE may perform OP.INVK\_INTERFACE upon an O.JAVAOBJECT with Context attribute different from the currently active context, whose Sharing attribute has the value "SIO", and whose Context attribute has the value "CAP file AID", only if the invoked interface method extends the Shareable interface and one of the following applies:

ST

- (a) The value of the attribute Selection Status of the CAP file whose AID is "Package AID" is "Multiselectable".
- (b) The value of the attribute Selection Status of the CAP file whose AID is "Package AID' is "Nonmultiselectable», and either "CAP file AID" is the value of the currently selected applet or otherwise "CAP file AID" does not occur in the attribute ActiveApplets.
- R.JAVA.5 An S.CAP\_FILE may perform an OP.CREATE only if the value of the Sharing parameter(\*) is "Standard".
- R.JAVA.6 ([JCRE3], §6.2.8): S.CAP\_FILE may freely perform OP.ARRAY\_ACCESS or OP.ARRAY LENGTH upon any O.JAVAOBJECT whose Sharing attribute has value "global array".

Application Note (R.JAVA.4): The initial setting of security attributes ActiveApplets and Selected Applet Context are initialized by SELECT APDU and MANAGE\_CHANNEL, which are out of SPM scope. The ActiveApplets and Selected Applet Context are never changed in the VM scope.

**FDP\_ACF.1.3/FIREWALL** The TSF shall explicitly authorize access of subjects to objects based on the following additional rules:

- 1) The subject S.JCRE can freely perform OP.JAVA(...) and OP.CREATE, with the exception given in FDP\_ACF.1.4/FIREWALL, provided it is the Currently Active Context.
- 2) The only means that the subject S.JCVM shall provide for an application to execute native code is the invocation of a Java Card API method (through OP.INVK\_INTERFACE or OP.INVK\_VIRTUAL).

**FDP\_ACF.1.4/FIREWALL** The TSF shall explicitly deny access of subjects to objects based on the following additional rules:

- 1) Any subject with OP.JAVA upon an O.JAVAOBJECT whose LifeTime attribute has value "CLEAR\_ON\_DESELECT" if O.JAVAOBJECT's Context attribute is not the same as the Selected Applet Context.
- 2) Any subject attempting to create an object by the means of OP.CREATE and a "CLEAR\_ON\_DESELECT" LifeTime parameter if the active context is not the same as the Selected Applet Context.

Application note: This rule is out of scope of the SPM modelisation because CLEAR\_ON\_DESELECT objects can be created exclusively in the API, which is also out of scope (Hypothesis 4 of the SPM document [MAV51\_SPM])..

- 3) S.CAP\_FILE performing OP.ARRAY\_AASTORE of the reference of an O.JAVAOBJECT whose sharing attribute has value "global array" or "Temporary JCRE entry point".
- 4) S.CAP\_FILE performing OP.PUTFIELD or OP.PUTSTATIC of the reference of an O.JAVAOBJECT whose sharing attribute has value "global array" or "Temporary JCRE entry point"
- 5) R.JAVA.7 ([JCRE3], §6.2.8.2): S.CAP\_FILE performing OP.ARRAY\_T\_ASTORE of the reference of an O.JAVAOBJECT, or a primitive value when the O.JAVAOBJECT is an array view without ATTR\_WRITABLE\_VIEW access attribute.
- 6) R.JAVA.8 ([JCRE3], §6.2.8.2):S.CAP\_FILE performing OP.ARRAY\_T\_ALOAD of the reference of an O.JAVAOBJECT, or a primitive value when the O.JAVAOBJECT is an array view without ATTR\_READABLE\_VIEW access attribute.

Application note: FDP\_ACF.1.4/FIREWALL:

The initial setting of security attribute Selected Applet Context is initilized by SELECT APDU, which is out of SPM scope. Selected Applet Context is never changed in the VM scope.

The deletion of applets may render some O.JAVAOBJECT inaccessible, and the Java Card RE may be in charge of this aspect. This can be done, for instance, by ensuring that references to objects belonging to a deleted application are considered as a null reference. Such a mechanism is implementation-dependent.

### The deletion of applets is out of scope of this SPM scope.

In the case of an array type, fields are components of the array ([JVM], §2.14, §2.7.7), as well as the length; the only methods of an array object are those inherited from the Object class.

The Sharing attribute defines five categories of objects:

- Standard ones, whose both fields and methods are under the firewall policy,
- Shareable interface Objects (SIO), which provide a secure mechanism for inter-applet communication,

- JCRE entry points (Temporary or Permanent), who have freely accessible methods but protected fields,
- Global arrays, having both unprotected fields (including components; refer to JavaCardClass discussion above) and methods.
- Array Views, having fields/elements access controlled by access control attributes, ATTR\_READABLE\_VIEW and ATTR\_WRITABLE\_VIEW and methods.

When a new object is created, it is associated with the Currently Active Context. But the object is owned by the applet instance within the Currently Active Context when the object is instantiated ([JCRE3], §6.1.3). An object is owned by an applet instance, by the JCRE or by the CAP file library where it has been defined (these latter objects can only be arrays that initialize static fields of CAP file).

([JCRE3], Glossary) Selected Applet Context. The Java Card RE keeps track of the currently selected Java Card applet. Upon receiving a SELECT command with this applet's AID, the Java Card RE makes this applet the Selected Applet Context. The Java Card RE sends all APDU commands to the Selected Applet Context.

While the expression "Selected Applet Context" refers to a specific installed applet, the relevant aspect to the policy is the context (CAP file AID) of the selected applet. In this policy, the "Selected Applet Context" is the AID of the selected CAP file.

([JCRE3], §6.1.2.1) At any point in time, there is only one active context within the Java Card VM (this is called the Currently Active Context).

It should be noticed that the invocation of static methods (or access to a static field) is not considered by this policy, as there are no firewall rules. They have no effect on the active context as well and the "acting CAP file" is not the one to which the static method belongs to in this case.

The Java Card platform, version 2.2.x introduces the possibility for an applet instance to be selected on multiple logical channels at the same time, or accepting other applets belonging to the same CAP file being selected simultaneously. These applets are referred to as multiselectable applets. Applets that belong to a same CAP file are either all multiselectable or not ([JCVM3], §2.2.5). Therefore, the selection mode can be regarded as an attribute of CAP file. No selection mode is defined for a library CAP file.

An applet instance will be considered an active applet instance if it is currently selected in at least one logical channel. An applet instance is the currently selected applet instance only if it is processing the current command. There can only be one currently selected applet instance at a given time. ([JCRE3], §4).

#### FDP IFC.1/JCVM Subset information flow control

FDP\_IFC.1.1/JCVM The TSF shall enforce the JCVM information flow control SFP on S.JCVM, S.LOCAL, S.MEMBER, I.DATA and OP.PUT (S1, S2, I).

#### Application note:

ST

References of temporary Java Card RE entry points, which cannot be stored in class variables, instance variables or array components, are transferred from the internal memory of the Java Card RE (TSF data) to some stack through specific APIs (Java Card RE owned exceptions) or Java Card RE invoked methods (such as the process (APDU apdu)); these are causes of OP.PUT (S1, S2, I) operations as well.

#### FDP IFF.1/JCVM Simple security attributes

**FDP\_IFF.1.1/JCVM** The TSF shall enforce the **JCVM information flow control SFP** based on the following types of subject and information security attributes:

| Subject / Information | Description               |
|-----------------------|---------------------------|
| S.JCVM                | Currently active context. |

**FDP\_IFF.1.2/JCVM** The TSF shall permit an information flow between a controlled subject and controlled information via a controlled operation if the following rules hold:

- An operation OP.PUT (S1, S.MEMBER, I.DATA) is allowed if and only if the active context is "Java Card RE";
- Other OP.PUT operations are allowed regardless of the Currently Active Context's value.

FDP\_IFF.1.3/JCVM The TSF shall enforce no additional information flow control SFP rules.

**FDP\_IFF.1.4/JCVM** The TSF shall explicitly authorize an information flow based on the following rules: **no additional information flow control SFP rules**.

Ref: D1569436\_LITE Rev: 1.25 Page: 96 / 189

FDP\_IFF.1.5/JCVM The TSF shall explicitly deny an information flow based on the following rules: no additional information flow control SFP rules.

**Application Note:** 

The storage of temporary Java Card RE-owned objects references is runtime-enforced ([JCRE3], §6.2.8.1-3).

It should be noticed that this policy essentially applies to the execution of bytecode. Native methods, the Java Card RE itself and possibly some API methods can be granted specific rights or limitations through the FDP\_IFF.1.3/JCVM to FDP\_IFF.1.5/JCVM elements. The way the Java Card virtual machine manages the transfer of values on the stack and local variables (returned values, uncaught exceptions) from and to internal registers is implementation-dependent. For instance, a returned reference, depending on the implementation of the stack frame, may transit through an internal register prior to being pushed on the stack of the invoker. The returned bytecode would cause more than one OP.PUT operation under this scheme.

#### FDP RIP.1/OBJECTS Subset residual information protection

**FDP\_RIP.1.1/OBJECTS** The TSF shall ensure that any previous information content of a resource is made unavailable upon the **allocation of the resource to** the following objects: **class instances and arrays**.

#### FMT MSA.1/JCRE Management of security attributes

FMT\_MSA.1.1/JCRE The TSF shall enforce the FIREWALL access control SFP to restrict the ability to modify the security attributes the Selected Applet Context to the Java Card RE (S.JCRE).

Application note:

The modification of the Selected Applet Context is performed in accordance with the rules given in [JCRE3], §4 and [JCVM3], §3.4.

The initial setting of security attribute the Selected Applet Context is initialized by SELECT APDU and MANAGE\_CHANNEL, which are out of SPM scope. The the Selected Applet Context is never changed in the VM scope.

#### FMT\_MSA.1/JCVM Management of security attributes

FMT\_MSA.1.1/JCVM The TSF shall enforce the FIREWALL access control SFP and the JCVM information flow control SFP to restrict the ability to modify the security attributes the currently active context and the Active Applets security attributes to the Java Card VM (S.JCVM).

Application note:

The modification of the Selected Applet Context is performed in accordance with the rules given in [JCRE3], §4 and [JCVM3], §3.4.

The initial setting of security attribute ActiveApplets is initilized by SELECT APDU and MANAGE\_CHANNEL, which are out of SPM scope. The ActiveApplets is never changed in the VM scope.

#### FMT\_MSA.2/FIREWALL\_JCVM Secure security attributes

FMT\_MSA.2.1/FIREWALL\_JCVM The TSF shall ensure that only secure values are accepted for all the security attributes of subjects and objects defined in the FIREWALL access control SFP and the JCVM information flow control SFP.

#### FMT MSA.3/FIREWALL Static attribute initialization

**FMT\_MSA.3.1/FIREWALL** The TSF shall enforce the **FIREWALL** access control **SFP** to provide **restrictive** default values for security attributes that are used to enforce the SFP.

**FMT\_MSA.3.2/FIREWALL[Editorially Refined]** The TSF shall not allow **any role** to specify alternative initial values to override the default values when an object or information is created.

Application Note:

ST

FMT MSA.3.1/FIREWALL

Objects' security attributes of the access control policy are created and initialized at the creation of the object
or the subject. Afterwards, these attributes are no longer mutable (FMT\_MSA.1/JCRE). At the creation of an
object (OP.CREATE), the newly created object, assuming that the FIREWALL access control SFP permits the

operation, gets its Lifetime and Sharing attributes from the parameters of the operation; on the contrary, its Context attribute has a default value, which is its creator's Context attribute and AID respectively ([JCRE3], §6.1.3). There is one default value for the Selected Applet Context that is the default applet identifier's Context, and one default value for the Currently Active Context that is "Java Card RE".

• The knowledge of which reference corresponds to a temporary entry point object or a global array and which does not is solely available to the Java Card RE (and the Java Card virtual machine).

#### FMT MSA.3.2/FIREWALL

The intent is that none of the identified roles has privileges with regard to the default values of the security
attributes. It should be noticed that creation of objects is an operation controlled by the FIREWALL access
control SFP. The operation shall fail anyway if the created object would have had security attributes whose
value violates FMT\_MSA.2.1/FIREWALL\_JCVM.

#### FMT\_MSA.3/JCVM Static attribute initialization

**FMT\_MSA.3.1/JCVM** The TSF shall enforce the **JCVM information flow control SFP** to provide **restrictive** default values for security attributes that are used to enforce the SFP.

**FMT\_MSA.3.2/JCVM[Editorially Refined]** The TSF shall not allow **any role** to specify alternative initial values to override the default values when an object or information is created.

#### FMT\_SMR.1/JCRE Security roles

FMT SMR.1.1/JCRE The TSF shall maintain the roles:

- the Java Card RE (JCRE).
- the Java Card VM (JCVM).

FMT SMR.1.2/JCRE The TSF shall be able to associate users with roles.

#### FMT\_SMF.1/CORE\_LC Specification of Management Functions

FMT\_SMF.1.1/Core\_LC The TSF shall be capable of performing the following management functions:

Modify the Currently Active Context, the Selected Applet Context, and the Active Applets

Note: the Selected Applet context is out of scope of the VM functionalities. It is a process that occurs prior to VM start

The initial setting of security attributes ActiveApplets and Selected Applet Context are initilized by SELECT APDU and MANAGE\_CHANNEL, which are out of SPM scope. The ActiveApplets and Selected Applet Context are never changed in the VM scope.

#### 8.1.1.1.2 Application Programming Interface

The following SFRs are related to the Java Card API.

The execution of the additional native code is not within the TSF. Nevertheless, access to API native methods from the Java Card System is controlled by TSF because there is no difference between native and interpreted methods in the interface or the invocation mechanism.

#### FCS\_CKM.1 Cryptographic key generation

ST

FCS\_CKM.1.1 The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [assignment: cryptographic key generation algorithm] and specified cryptographic key sizes [assignment: cryptographic key sizes] that meet the following: [assignment: list of standards].

| Iteration | Algorithm                   | Key size               | Standards  |
|-----------|-----------------------------|------------------------|------------|
| /RSA Std  | RSA standard key generation | 1024, 1536, 2048       | ANSI X9.31 |
| /RSA CRT  | RSA CRT key generation      | 1024, 1536, 2048, 4096 | ANSI X9.31 |

| /GP    | GP session keys    | 112 (for SCP01, SCP02)<br>128,192, 256 (for SCP03) | [GP23] (for SCP01,<br>SCP02) |
|--------|--------------------|--|------------------------------|
|        |                    |  | [GP23] (for SCP03)           |
| /ECFP  | ECC key generation | 160, 192, 224, 256, 320, 384, 512, 521             | ANSI X9.62                   |
| /ECDH  | EC Diffie-Hellman  | 160, 192, 224, 256, 320, 384, 512, 521             | ANSI X9.63                   |
| /DHGen | DH key generation  | 1024, 1280 ,1536, 2048                             | ANSI X9.42                   |
| /DH    | DH key exchange    | 1024, 1280,1536, 2048                              | ANSI X9.42                   |

#### Application note:

 The keys are generated and diversified in accordance with [JCAPI3] specification in classes KeyBuilder and KeyPair (at least Session key generation) and RandomData.

#### FCS\_CKM.2 Cryptographic key distribution

FCS\_CKM.2.1 The TSF shall distribute cryptographic keys in accordance with a specified cryptographic key distribution method [assignment: cryptographic key distribution method] that meets the following: [assignment: list of standards].

#### For Applications:

| iteration | Distribution method | standards                |
|-----------|---------------------|--------------------------|
| /RSA      | JC API setkey()     | [JCAPI3]                 |
| /TDES     | JC API setkey()     | [JCAPI3]                 |
| /AES      | JC API setkey()     | [JCAPI3]                 |
| /ECFP     | JC API setkey()     | [JCAPI3]                 |
| /DH       | Thales API setkey() | Thales DIS specification |

Note: The "/DH Thales API setkey()" is part of proprietary API that are not publicly documented (Thales DIS Specification).

For GP:

ST

STORE DATA command, standard [JCAPI3] PUT KEY command, standard [JCAPI3]

#### FCS\_CKM.3 Cryptographic key access

FCS\_CKM.3.1 The TSF shall perform [assignment: type of cryptographic key access] in accordance with a specified cryptographic key access method [assignment: cryptographic key access method] that meets the following: [assignment: list of standards].

| iteration | Key access method standards |                          |
|-----------|-----------------------------|--------------------------|
| /RSA      | JC API getkey()             | [JCAPI3]                 |
| /TDES     | JC API getkey()             | [JCAPI3]                 |
| /AES      | JC API getkey()             | [JCAPI3]                 |
| /ECFP     | JC API getkey()             | [JCAPI3]                 |
| /DH       | Thales API getkey()         | Thales DIS specification |

Note: The "/DH Thales API getkey()" is part of proprietary API that are not publicly documented (Thales DIS Specification).

#### FCS\_CKM.4 Cryptographic key destruction

**FCS\_CKM.4.1** The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method **physical irreversible destruction of the stored key value** that meets the following: **No standard**. Application note:

• The keys are reset in accordance with [JCAPI3] in class Key with the method clearKey(). Any access to a cleared key attempting to use it for ciphering or signing shall throw an exception.

#### FCS\_COP.1 Cryptographic operation

FCS\_COP.1.1 The TSF shall perform [assignment: list of cryptographic operations] in accordance with a specified cryptographic algorithm [assignment: cryptographic algorithm] and cryptographic key sizes [assignment: cryptographic key sizes] that meet the following: [assignment: list of standards].

| Iteration           | operation                  | algorithm              | Key size   | Standards   |
|---------------------|----------------------------|------------------------|--|---|
| /RSA-SIGN           | Signature,<br>verification | RSA (STD)<br>RSA CRT   | 1024, 1152, 1280,<br>1536 and 2048<br>3072, 4096 | [ISO9796-2] RSA SHA<br>PKCS#1<br>RSA SHA PKCS#1 PSS                               |
| /RSA-<br>CIPHER     | Encryption, decryption     | RSA (STD)<br>RSA (CRT) | 1024, 1152, 1280,<br>1536 and 2048<br>3072, 4096 | [ISO9796-2] RSA SHA<br>PKCS#1<br>OAEP   |
| /ECC-SIGN           | Signature, verification    | ECC                    | 160, 192, 224, 256, 320, 384, 512, 521           | [TR-03111] ECDSA SHA  |
| /TDES-<br>CIPHER    | Encryption, decryption     | TDES                   | 112, 168   | [SP800-67] [ISO9797-1] DES NOPAD DES PKCS#5 DES 9797 M1 M2                        |
| /AES-<br>CIPHER     | Encryption, decryption     | AES                    | 128, 192, 256                                    | [FIPS197] AES 128<br>NOPAD  |
| /AESCIPHER<br>FAST  | Encryption, decryption     | AES                    | 128, 192, 256                                    | [FIPS197] AES 128<br>NOPAD  |
| /TDESCIPHER<br>FAST | Encryption, decryption     | TDES                   | 112, 168   | [SP800-67] [ISO9797-1] DES NOPAD DES PKCS#5 DES 9797 M1 M2                        |
| /TDES-MAC           | Signature,<br>Verification | TDES                   | 112, 168   | [SP800-67] [ISO9797-1] DES MAC ISO9797-1 M1 M2 Alog3 DES MAC NOPAD DES MAC PKCS#5 |

#### FDP RIP.1/ABORT Subset residual information protection

**FDP\_RIP.1.1/ABORT** The TSF shall ensure that any previous information content of a resource is made unavailable upon the **deallocation of the resource from** the following objects: **any reference to an object instance created during an aborted transaction**.

#### FDP\_RIP.1/APDU Subset residual information protection

**FDP\_RIP.1.1/APDU** The TSF shall ensure that any previous information content of a resource is made unavailable upon the **allocation of the resource to** the following objects: **the APDU buffer**.

#### FDP\_RIP.1/GlobalArray Subset residual information protection

#### FDP RIP.1.1/GlobalArray [Refined]

The TSF shall ensure that any previous information content of a resource is made unavailable upon **deallocation of the resource from** *the applet as a result of returning from the process method to* the following objects: **a user Global Array**.

#### Application Note:

An array resource is allocated when a call to the API method JCSystem.makeGlobalArray is performed. The Global Array is created as a transient JCRE Entry Point Object ensuring that reference to it cannot be retained by any application. On return from the method which called JCSystem.makeGlobalArray, the array is no longer available to any applet and is deleted and the memory in use by the array is cleared and reclaimed in the next object deletion cycle.

#### FDP RIP.1/bArray Subset residual information protection

**FDP\_RIP.1.1/bArray** The TSF shall ensure that any previous information content of a resource is made unavailable upon the **deallocation of the resource from** the following objects: **the bArray object**.

#### Application Note:

ST

A resource is allocated to the bArray object when a call to an applet's install() method is performed. There is no conflict with FDP\_ROL.1 here because of the bounds on the rollback mechanism (FDP\_ROL.1.2/FIREWALL): the scope of the rollback does not extend outside the execution of the install() method, and the de-allocation occurs precisely right after the return of it.

#### FDP RIP.1/KEYS Subset residual information protection

**FDP\_RIP.1.1/KEYS** The TSF shall ensure that any previous information content of a resource is made unavailable upon the **deallocation of the resource from** the following objects: **the cryptographic buffer (D.CRYPTO)**.

#### FDP\_RIP.1/TRANSIENT Subset residual information protection

**FDP\_RIP.1.1/TRANSIENT** The TSF shall ensure that any previous information content of a resource is made unavailable upon the **deallocation of the resource from** the following objects: **any transient object**.

#### **Application Note:**

- The events that provoke the de-allocation of any transient object are described in [JCRE3], §5.1.
- The clearing of CLEAR\_ON\_DESELECT objects is not necessarily performed when the owner of the objects is deselected. In the presence of multiselectable applet instances, CLEAR\_ON\_DESELECT memory segments may be attached to applets that are active in different logical channels. Multiselectable applet instances within a same CAP file must share the transient memory segment if they are concurrently active ([JCRE3], §4.238.

#### FDP ROL.1/FIREWALL Basic rollback

FDP\_ROL.1.1/FIREWALL The TSF shall enforce the FIREWALL access control SFP and the JCVM information flow control SFP to permit the rollback of the operations OP.JAVA and OP.CREATE on the O.JAVAOBJECTs.

FDP\_ROL.1.2/FIREWALL The TSF shall permit operations to be rolled back within the scope of a select(), deselect(), process(), install() or uninstall() call, notwithstanding the restrictions given in [JCRE3], §7.7, within the bounds of the Commit Capacity ([JCRE3], §7.8), and those described in [JCAPI3].

#### **Application Note:**

Transactions are a service offered by the APIs to applets. It is also used by some APIs to guarantee the atomicity of some operation. This mechanism is either implemented in Java Card platform or relies on the transaction mechanism offered by the underlying platform. Some operations of the API are not conditionally updated, as documented in [JCAPI3] (see for instance, PIN-blocking, PIN-checking, update of Transient objects). Card Security Management

#### FAU\_ARP.1 Security alarms

#### FAU ARP.1.1 The TSF shall take the following actions:

- throw an exception,
- · or lock the card session
- or reinitialize the Java Card System and its data upon detection of a potential security violation.

#### Refinement:

The TOE detects the following potential security violation:

- CAP file inconsistency
- Applet life cycle inconsistency
- Card Manager life cycle inconsistency
- Card tearing (unexpected removal of the Card out of the CAD) and power failure
- Abortion of a transaction in an unexpected context (see abortTransaction(), [JCAPI3] and ([JCRE3], §7.6.2)
- · Violation of the Firewall or JCVM SFPs
- Unavailability of resources
- Array overflow
- Random trap detection

#### Application Note:

ST

- The developer shall provide the exhaustive list of actual potential security violations the TOE reacts to. For instance, other runtime errors related to applet's failure like uncaught exceptions.
- The bytecode verification defines a large set of rules used to detect a "potential security violation". The actual
  monitoring of these "events" within the TOE only makes sense when the bytecode verification is performed on -card.

Ref: D1569436\_LITE Rev: 1.25 Page: 102 / 189

- Depending on the context of use and the required security level, there are cases where the card manager and the TOE must work in cooperation to detect and appropriately react in case of potential security violation. This behavior must be described in this component. It shall detail the nature of the feedback information provided to the card manager (like the identity of the offending application) and the conditions under which the feedback will occur (any occurrence of the java.lang.SecurityException exception).
- The "locking of the card session" may not appear in the policy of the card manager. Such measure should only be taken in case of severe violation detection; the same holds for the re-initialization of the Java Card System. Moreover, the locking should occur when "clean" re-initialization seems to be impossible.
- The locking may be implemented at the level of the Java Card System as a denial of service (through some systematic "fatal error" message or return value) that lasts up to the next "RESET" event, without affecting other components of the card (such as the card manager). Finally, because the installation of applets is a sensitive process, security alerts in this case should also be carefully considered herein.

#### FDP\_SDI.2/DATA Stored data integrity monitoring and action

**FDP\_SDI.2.1/DATA** The TSF shall monitor user data stored in containers controlled by the TSF for **integrity errors** on all objects, based on the following attributes: **integrity-sensitive data**.

FDP\_SDI.2.2/DATA Upon detection of a data integrity error, the TSF shall *Prevent the use of modified data Raise an exception* 

#### Application note:

- Although no such requirement is mandatory in the Java Card specification, at least an exception shall be raised upon integrity errors detection on cryptographic keys, PIN values and their associated security attributes. Even if all the objects cannot be monitored, cryptographic keys and PIN objects shall be considered with particular attention by ST authors as they play a key role in the overall security.
- It is also recommended to monitor integrity errors in the code of the native applications and Java Card applets. For integrity sensitive application, their data shall be monitored (D.APP\_I\_DATA): applications may need to protect information against unexpected modifications, and explicitly control whether a piece of information has been changed between two accesses. For example, maintaining the integrity of an electronic purse's balance is extremely important because this value represents real money. Its modification must be controlled, for illegal ones would denote an important failure of the payment system.
  - A dedicated library could be implemented and made available to developers to achieve better security for specific objects, following the same pattern that already exists in cryptographic APIs, for instance.

#### FPR\_UNO.1 Unobservability

**FPR\_UNO.1.1** The TSF shall ensure that **unauthorized users** are unable to observe the operation **cryptographic operations / comparisons operations** on **Key values / PIN values** by **S.JCRE, S.Applet**.

#### Application Note:

The non-observability of operations on sensitive information such as keys appears as impossible to circumvent in the smart card world. The precise list of operations and objects is left unspecified, but should at least concern secret keys and PIN values when they exist on the card, as well as the cryptographic operations and comparisons performed on them.

#### FPT\_FLS.1/JCS Failure with preservation of secure state

**FPT\_FLS.1.1/JCS** The TSF shall preserve a secure state when the following types of failures occur: **those associated to the potential security violations described in FAU\_ARP.1**.

#### Application note:

ST

The Java Card RE Context is the Current context when the Java Card VM begins running after a card reset ([JCRE3], §6.2.3) or after a proximity card (PICC) activation sequence ([JCRE3]). Behavior of the TOE on power loss and reset is described in [JCRE3], §3.6, and §7.1. Behavior of the TOE on RF signal loss is described in [JCRE3], §3.6.2.

Ref: D1569436\_LITE Rev: 1.25 Page: 103 / 189

#### FPT TDC.1 Inter-TSF basic TSF data consistency

**FPT\_TDC.1.1** The TSF shall provide the capability to consistently interpret **the CAP files**, **the bytecode and its data argument**, when shared between the TSF and another trusted IT product.

#### FPT TDC.1.2 The TSF shall use

- The rules defined in [JCVM3] specification
- · The API tokens defined in the export files of reference implementation
- The rules defined in ISO 7816-6
- The rules defined in [GP23] specification when interpreting the TSF data from another trusted IT product.

#### Application note:

Concerning the interpretation of data between the TOE and the underlying Java Card platform, it is assumed that the TOE is developed consistently with the SCP functions, including memory management, I/O functions and cryptographic functions.

#### 8.1.1.1.3 AID Management

#### FIA ATD.1/AID User attribute definition

FIA ATD.1.1/AID The TSF shall maintain the following list of security attributes belonging to individual users:

- CAP file AID
- Applet's version number
- registered applet's AID
- · applet selection status

#### Application note:

"Individual users" stands for applets.

#### FIA UID.2/AID User identification before any action

**FIA\_UID.2.1/AID** The TSF shall require each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.

#### Application notes:

- By users here it must be understood the ones associated to the CAP file (or applets) that act as subjects of
  policies. In the Java Card System, every action is always performed by an identified user interpreted here as
  the currently selected applet or the CAP file that is the subject's owner. Means of identification are provided
  during the loading procedure of the CAP file and the registration of applet instances.
- The role Java Card RE defined in FMT\_SMR.1/JCRE is attached to an IT security function rather than to a
  "user" of the CC terminology. The Java Card RE does not "identify" itself with respect to the TOE, but it is a part
  of it.

#### FIA\_USB.1/AID User-subject binding

**FIA\_USB.1.1/AID** The TSF shall associate the following user security attributes with subjects acting on the behalf of that user: **CAP file AID**.

**FIA\_USB.1.2/AID** The TSF shall enforce the following rules on the initial association of user security attributes with subjects acting on the behalf of users:

- Initial applet selection is performed as described in [JCRE3]§4
- The default applet depends on personalization.

**FIA\_USB.1.3/AID** The TSF shall enforce the following rules governing changes to the user security attributes associated with subjects acting on the behalf of users:

Applet selection is performed after a successful SELECT FILE command as described in [JCRE3]§4.

#### Application note:

ST

• The user is the applet and the subject is the S.CAP\_FILE. The subject security attribute "Context" shall hold the user security attribute "CAP file AID".

Ref: D1569436\_LITE Rev: 1.25 Page: 104 / 189

#### FMT MTD.1/JCRE Management of TSF data

**FMT\_MTD.1.1/JCRE** The TSF shall restrict the ability to **modify** the **list of registered applets' AIDs** to **the JCRE**. Application Note:

- The installer and the Java Card RE manage other TSF data such as the applet life cycle or CAP files, but this
  management is implementation specific. Objects in the Java programming language may also try to query
  AIDs of installed applets through the lookupAID(...) API method.
- The installer, applet deletion manager or even the card manager may be granted the right to modify the list of registered applets' AIDs in specific implementations (possibly needed for installation and deletion; see #.DELETION and #.INSTALL).
- The DELETE and INSTALL APDU commands are out of scope of this SPM. The list of registred applets' AIDs is proven to be not modified during the execution inside the VM.

#### FMT MTD.3/JCRE Secure TSF data

FMT\_MTD.3.1/JCRE The TSF shall ensure that only secure values are accepted for the AIDs of registered applets.

#### 8.1.1.2 INSTG Security Functional Requirements

This group combines the SFRs related to the installation of the applets, which addresses security aspects outside the runtime. The installation of applets is a critical phase, which lies partially out of the boundaries of the firewall, and therefore requires specific treatment. In this ST, loading a CAP file or installing an applet modeled as an importation of user data (that is, user application's data) with its security attributes (such as the parameters of the applet used in the firewall rules).

#### FDP\_ITC.2/Installer Import of user data with security attributes

Refinement: This SFR is replaced by the SFR **FDP\_ITC.2/GP-ELF** defined in [PP-GP] and describe in the §7.1.2.1 (Security Functional Requirements from PP Global Platform Secure Element)

#### FMT\_SMR.1/Installer Security roles

ST

Refinement: This SFR is replaced by the SFR **FMT\_SMR.1/GP** defined in [PP-GP] and describe in the §7.1.2.7 (Security Functional Requirements from PP Global Platform Secure Element)

#### FPT\_FLS.1/Installer Failure with preservation of secure state

Refinement: This SFR is replaced by the SFR **FPT\_FLS.1/GP** defined in [PP-GP] and describe in the §7.1.2.7 (Security Functional Requirements from PP Global Platform Secure Element)

#### FPT\_RCV.3/Installer Automated recovery without undue loss

Refinement: This SFR is replaced by the SFR **FPT\_RCV.3/GP** defined in [PP-GP] and describe in the §7.1.2.7 (Security Functional Requirements from PP Global Platform Secure Element)

8.1.1.3 ADELG Security Functional Requirements

This group consists of the SFRs related to the deletion of applets and/or CAP file, enforcing the applet deletion manager (ADEL) policy on security aspects outside the runtime. Deletion is a critical phase and therefore requires specific treatment.

#### FDP ACC.2/ADEL Complete access control

FDP\_ACC.2.1/ADEL The TSF shall enforce the ADEL access control SFP on S.ADEL, S.JCRE, S.JCVM, O.JAVAOBJECT, O.APPLET and O.CODE\_CAP\_FILE and all operations among subjects and objects covered by the SFP.

#### Refinement:

The operations involved in the policy are:

- OP DELETE APPLET,
- OP.DELETE CAP FILE,
- OP.DELETE\_CAP\_FILE\_APPLET.

**FDP\_ACC.2.2/ADEL** The TSF shall ensure that all operations between any subject controlled by the TSF and any object controlled by the TSF are covered by an access control SFP.

#### FDP\_ACF.1/ADEL Security attribute based access control

FDP\_ACF.1.1/ADEL The TSF shall enforce the ADEL access control SFP to objects based on the following:

| Subject/Object  | Attributes  |
|-----------------|---|
| S.JCVM          | Active Applets  |
| S.JCRE          | Selected Applet Context, Registered Applets, Resident CAP files |
| O.CODE_CAP_FILE | CAP file AID, Dependent CAP file AID, Static References         |
| O.APPLET        | Applet Selection Status   |
| O.JAVAOBJECT    | Owner, Remote   |

**FDP\_ACF.1.2/ADEL** The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:

In the context of this policy, an object O is reachable if and only if one of the following conditions holds:

- (1) the owner of O is a registered applet instance A (O is reachable from A),
- (2) a static field of a resident CAP file P contains a reference to O (O is reachable from P),
- (3) there exists a valid remote reference to O (O is remote reachable), and
- (4) there exists an object O' that is reachable according to either (1) or (2) or (3) above and O' contains a reference to O (the reachability status of O is that of O').

The following access control rules determine when an operation among controlled subjects and objects is allowed by the policy:

R.JAVA.14 ([JCRE3], §11.3.4.2, Applet Instance Deletion). The S.ADEL may perform OP.DELETE\_APPLET upon an O.APPLET only if,

- (1) S.ADEL is currently selected,
- (2) There is no instance in the context of O.APPLET that is active in any logical channel and
- (3) there is no O.JAVAOBJECT owned by O.APPLET such that either O.JAVAOBJECT is reachable from an applet instance distinct from O.APPLET, or O.JAVAOBJECT is reachable from a CAP File P, or ([JCRE3], §8.5) O.JAVAOBJECT is remote reachable.

R.JAVA.15 ([JCRE3], §11.3.4.2, Multiple Applet Instance Deletion). S.ADEL may perform OP.DELETE\_APPLET upon several O.APPLET only if,

(1) S.ADEL is currently selected,

ST

- (2) There is no instance in the context of O.APPLET that is active in any logical channel and
- (3) there is no O.JAVAOBJECT owned by any of the O.APPLET being deleted such that either
- O.JAVAOBJECT is reachable from an applet instance distinct from any of those O.APPLET, or
- O.JAVAOBJECT is reachable from a CAP file P, or ([JCRE3], §8.5) O.JAVAOBJECT is remote reachable.

R.JAVA.16 ([JCRE3], §11.3.4.3, Applet/Library CAP file Deletion). The S.ADEL may perform OP.DELETE CAP FILE upon an O.CODE CAP FILE only if,

- (1) S.ADEL is currently selected,
- (2) no reachable O.JAVAOBJECT, from a CAP file distinct from O.CODE\_CAP\_FILE that is an instance of a class that belongs to O.CODE\_CAP\_FILE exists on the card and
- (3) there is no resident CAP file on the card that depends on O.CODE\_CAP\_FILE.

R.JAVA.17 ([JCRE3], §11.3.4.4, Applet CAP file and Contained Instances Deletion). S.ADEL may perform OP.DELETE\_CAP\_FILE\_APPLET upon an O.CODE\_CAP\_FILE only if,

- (1) S.ADEL is currently selected,
- (2) no reachable O.JAVAOBJECT, from a CAP file distinct from O.CODE\_CAP\_FILE, which is an instance of a class that belongs to O.CODE\_CAP\_FILE exists on the card,
- (3) there is no CAP file loaded on the card that depends on O.CODE\_CAP\_FILE and
- (4) for every O.APPLET of those being deleted it holds that:
  - (i) There is no instance in the context of O.APPLET that is active in any logical channel and
  - (ii) there is no O.JAVAOBJECT owned by O.APPLET such that either O.JAVAOBJECT is reachable from an applet instance not being deleted, or O.JAVAOBJECT is reachable from a CAP file not being deleted, or ([JCRE3],§8.5) O.JAVAOBJECT is remote reachable.

#### Application notes:

ST

- This policy introduces the notion of reachability, which provides a general means to describe objects that are referenced from a certain applet instance or CAP file.
- S.ADEL calls the "uninstall" method of the applet instance to be deleted, if implemented by the applet, to inform it of the deletion request. The order in which these calls and the dependencies checks are performed are out of the scope of this security target.

**FDP\_ACF.1.3/ADEL** The TSF shall explicitly authorize access of subjects to objects based on the following additional rules: **none**.

FDP\_ACF.1.4/ADEL] The TSF shall explicitly deny access of subjects to objects based on the following additional rules: any subject but the S.ADEL to O.CODE\_CAP\_FILE or O.APPLET for the purpose of deleting it from the card.

#### FDP RIP.1/ADEL Subset residual information protection

FDP\_RIP.1.1/ADEL The TSF shall ensure that any previous information content of a resource is made unavailable upon the deallocation of the resource from the following objects: applet instances and/or CAP file when one of the deletion operations in FDP\_ACC.2.1/ADEL is performed on them. Application note:

Deleted freed resources (both code and data) may be reused, depending on the way they were deleted (logically or physically). Requirements on de-allocation during applet/CAP file deletion are described in [JCRE3], §11.3.4.1, §11.3.4.2 and §11.3.4.3.

#### FMT\_MSA.1/ADEL Management of security attributes

FMT\_MSA.1.1/ADEL The TSF shall enforce the ADEL access control SFP to restrict the ability to modify the security attributes: Registered Applets and Resident CAP file to the Java Card RE).

#### FMT MSA.3/ADEL Static attribute initialization

**FMT\_MSA.3.1/ADEL** The TSF shall enforce the **ADEL access control SFP** to provide **restrictive** default values for security attributes that are used to enforce the SFP.

**FMT\_MSA.3.2/ADEL** The TSF shall allow the **following role(s): none**, to specify alternative initial values to override the default values when an object or information is created.

#### FMT\_SMF.1/ADEL Specification of Management Functions

**FMT\_SMF.1.1/ADEL** The TSF shall be capable of performing the following management functions: **Modify the list of registered applets' AIDs and the Resident CAP file**.

#### FMT SMR.1/ADEL Security roles

FMT SMR.1.1/ADEL The TSF shall maintain the roles: the applet deletion manager.

FMT\_SMR.1.2/ADEL The TSF shall be able to associate users with roles.

#### FPT\_FLS.1/ADEL Failure with preservation of secure state

FPT\_FLS.1.1/ADEL The TSF shall preserve a secure state when the following types of failures occur: the applet deletion manager fails to delete a CAP file/applet as described in [JCRE3], §11.3.4. Application note:

- The TOE may provide additional feedback information to the card manager in case of a potential security violation (see FAU\_ARP.1).
- The applet instance deletion must be atomic. The "secure state" referred to in the requirement must comply with the Java Card specifications. That is, if a reset or power fail occurs during the deletion process, then before any applet is selected in card, either the applet instance deletion is completed or the applet shall be selectable and all objects owned by the applet remain unchanged (that is, the functionality of all applet instances on the card remains the same as prior to the unsuccessful deletion attempt) [JCRE3], §11.3.4.

#### 8.1.1.4 ODELG Security Functional Requirements

The following requirements concern the object deletion mechanism. This mechanism is triggered by the applet that owns the deleted objects by invoking a specific API method.

#### FDP\_RIP.1/ODEL Subset residual information protection

FDP\_RIP.1.1/ODEL The TSF shall ensure that any previous information content of a resource is made unavailable upon the deallocation of the resource from the following objects: the objects owned by the context of an applet instance which triggered the execution of the method javacard.framework.JCSystem.requestObjectDeletion().

**Application Note:** 

- Freed data resources resulting from the invocation of the method javacard.framework.JCSystem.requestObjectDeletion() may be reused. Requirements on de-allocation after the invocation of the method are described in [JCAPI3].
- There is no conflict with FDP\_ROL.1 here because of the bounds on the rollback mechanism: the execution of requestObjectDeletion() is not in the scope of the rollback because it must be performed in between APDU command processing, and therefore no transaction can be in progress.

#### FPT\_FLS.1/ODEL Failure with preservation of secure state

FPT\_FLS.1.1/ODEL The TSF shall preserve a secure state when the following types of failures occur: the object deletion functions fail to delete all the unreferenced objects owned by the applet that requested the execution of the method.

Application Note:

ST

The TOE may provide additional feedback information to the card manager in case of potential security violation (see FAU ARP.1).

### 8.1.1.5 CarG Security Functional Requirements

This group includes requirements for preventing the installation of CAP files that have not been by tecode verified, or that has been modified after bytecode verification.

#### FCO\_NRO.2/CM Enforced proof of origin

Refinement: This SFR is replaced by the SFR **FCO\_NRO.2/GP** defined in [PP-GP] and describe in the §7.1.2.7 (Security Functional Requirements from PP Global Platform Secure Element)

### FDP\_IFC.2/CM Complete information flow control

Refinement: This SFR is replaced by the SFR **FDP\_IFC.2/GP-ELF** defined in [PP-GP] and describe in the §7.1.2.1 (Security Functional Requirements from PP Global Platform Secure Element)

### FDP\_IFF.1/CM Simple security attributes

Refinement: This SFR is replaced by the SFR **FDP\_IFF.1/GP-ELF** defined in [PP-GP] and describe in the §7.1.2.1 (Security Functional Requirements from PP Global Platform Secure Element)

### FDP\_UIT.1/CM Data exchange integrity

Refinement: This SFR is replaced by the SFR **FDP\_UIT.1/GP** defined in [PP-GP] and describe in the §7.1.2.7 (Security Functional Requirements from PP Global Platform Secure Element)

### FIA\_UID.1/CM Timing of identification

Refinement: This SFR is replaced by the SFR **FIA\_UID.1/GP** defined in [PP-GP] and describe in the §7.1.2.7 (Security Functional Requirements from PP Global Platform Secure Element)

### FMT\_MSA.1/CM Management of security attributes

Refinement: This SFR is replaced by the SFR **FMT\_MSA.1/GP** defined in [PP-GP] and describe in the §7.2.1.7 (Security Functional Requirements from PP Global Platform Secure Element)

#### FMT MSA.3/CM Static attribute initialization

Refinement: This SFR is replaced by the SFR **FMT\_MSA.3/GP** defined in [PP-GP] and describe in the §7.2.1.7 (Security Functional Requirements from PP Global Platform Secure Element)

#### **FMT SMF.1/CM Specification of Management Functions**

Refinement: This SFR is replaced by the SFR **FMT\_SMF.1/GP** defined in [PP-GP] and describe in the §7.2.1.7 (Security Functional Requirements from PP Global Platform Secure Element)

#### FMT\_SMR.1/CM Security roles

ST

Refinement: This SFR is replaced by the SFR **FMT\_SMR.1/GP** defined in [PP-GP] and describe in the §7.2.1.7 (Security Functional Requirements from PP Global Platform Secure Element)

#### FTP ITC.1/CM Inter-TSF trusted channel

Refinement: This SFR is replaced by the SFR *FTP\_ITC.1/GP* defined in [PP-GP] and describe in the §7.2.1.7 (Security Functional Requirements from PP Global Platform Secure Element)

#### 8.1.1.6 SCPG Security Functional Requirements

This group contains the security requirements for the smart card platform, that is, operating system and chip that the Java Card System is implemented upon. The requirements are expressed in terms of security functional requirements from [CC2].

Ref: D1569436\_LITE Rev: 1.25 Page: 109 / 189

#### **FPT TST.1/SCPTSF Testing**

**FPT\_TST.1.1/SCP** The TSF shall run a suite of self-tests **periodically during normal operation** to demonstrate the correct operation of **security mechanisms of the IC**.

FPT\_TST.1.2/SCP The TSF shall provide authorized users with the capability to verify the integrity of Keys.

**FPT\_TST.1.3/SCP** The TSF shall provide authorized users with the capability to verify the integrity of **Applets**, **user PIN**, **user Keys**.

# FPT PHP.3/SCP Resistance to physical attacks

**FPT\_PHP.3.1/SCP** The TSF shall resist [**physical manipulation and physical probing**] to the [**all TOE components implementing the TSF**] by responding automatically such that the SFRs are always enforced.

#### FPT RCV.4/SCP Function recovery

**FPT\_RCV.4.1/SCP** The TSF shall ensure that **reading from and writing to static and objects' fields interrupted by power loss** have the property that the SF either completes successfully, or for the indicated failure scenarios, recovers to a consistent and secure state.

### 8.1.1.7 CMGR Group Security Functional Requirements

This group includes requirements for Card Manager.

#### FDP ACC.1/CMGR Subset access control

FDP\_ACC.1.1/CMGR The TSF shall enforce the CARD CONTENT MANAGEMENT access control SFP on loading of java code and keys by the Operator.

#### FDP ACF.1/CMGR Security attribute based access control

FDP\_ACF.1.1/CMGR The TSF shall enforce the CARD CONTENT MANAGEMENT access control SFP to objects based on the following:

Subjects: Byte Code Verifier, Operator, Issuer, Card Manager

Objects: applets and keys

ST

Security Attributes: DAP for applets; type and KEK for keys.

**FDP\_ACF.1.2/CMGR** The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:

The Card Manager loads applets into the card on behalf of the Byte Code Verifier.

The Card Manager extradites applets in the card on behalf of the Operator.

The Card Manager locks the loading of applets on the card on behalf of the Issuer. The

Card Manager loads GP keys into the cards on behalf of the Operator.

**FDP\_ACF.1.3/CMGR** The TSF shall explicitly authorize access of subjects to objects based on the following additional rules: **none**.

**FDP\_ACF.1.4/CMGR** The TSF shall explicitly deny access of subjects to objects based on the following additional rules: **Only Java packages can be loaded or deleted**.

### FMT\_MSA.1/CMGR Management of security attributes

**FMT\_MSA.1.1/CMGR** The TSF shall enforce the **CARD CONTENT MANAGEMENT access control SFP** to restrict the ability to **modify** the security attributes **code category** to **none**.

#### FMT\_MSA.3/CMGR Static attribute initialization

**FMT\_MSA.3.1/CMGR** The TSF shall enforce the **CARD CONTENT MANAGEMENT access control SFP** to provide **restrictive** default values for security attributes that are used to enforce the SFP.

**FMT\_MSA.3.2/CMGR** The TSF shall allow the **none** to specify alternative initial values to override the default values when an object or information is created.

Ref: D1569436\_LITE Rev: 1.25 Page: 110 / 189

#### 8.1.1.8 ASFR Group Security Functional Requirements

This group includes specific requirements for the TOE.

#### FPT FLS.1/SpecificAPI Failure with preservation of secure state

**FPT\_FLS.1.1/SpecificAPI** The TSF shall preserve a secure state when the following types of failures occur: **the** application fails to perform a specific execution flow control protected by the Specific API.

#### FPT ITT.1/SpecificAPI Basic internal TSF data transfer protection

**FPT\_ITT.1.1/SpecificAPI** The TSF shall protect TSF data from **disclosure and modification** when it is transmitted between separate parts of the TOE.

#### FPR\_UNO.1/SpecificAPI Unobservability

FPR\_UNO.1.1/SpecificAPI The TSF shall ensure that external attacker are unable to observe the operation as sensitive comparison or copy on sensitive objects defined by the application using the Specific API.

#### **Random Numbers**

ST

The TOE generates random numbers. To define the IT security functional requirements of the TOE an additional family (FCS\_RNG) of the Class FCS (cryptographic support) is defined in chapter 7.1. This family FCS\_RNG Generation of random numbers describes the functional requirements for random number generation used for cryptographic purposes.

The TOE shall meet the requirement "Quality metric for random numbers (FCS\_RNG.1)" as specified below (Common Criteria Part 2 extended).

#### FCS RNG.1 Random number generation

**FCS\_RNG.1.1** The TSF shall provide a **hybrid deterministic** random number generator that implements: (DRG.4.1) The internal state of the RNG shall use PTRNG of class PTG.2 as random source.

(DRG.4.2) The RNG provides forward secrecy.

(DRG.4.3) The RNG provides backward secrecy even if the current internal state is known.

(DRG.4.4) The RNG provides enhanced forward secrecy after calling the re-seed function that acts as a refreshing done at each random generation.

(DRG.4.5) The internal state of the RNG is seeded by an internal entropy source, PTRNG of class PTG.2.

#### FCS RNG.1.2 The TSF shall provide random numbers that meet:

RGS [RGS-B1] and [AIS31] DRG3 & DRG4.(DRG.4.6) The RNG generates output for which  $2^{35}$  strings of bit length 128 are mutually different with probability equal to  $(1 - 1/2^{58})$ .

(DRG.4.7) Statistical test suites cannot practically distinguish the random numbers from output sequences of an ideal RNG. The random numbers must pass test procedure A.

# 8.1.2 Security Functional Requirements from PACE Module

This section on security functional requirements for the TOE PACE module is divided into sub-section following the main security functionalities.

Operations in this section are in underline font when the SFR's operation is already present in [PP-EAC2], and in bold font when the operation is done in this ST. When the SFR is refined or assigned in the [PP-EAC2] and additionally refined or assigned in this ST then the font is bold and underline.

Note: actor identifier in the section corresponds to names described in [PP\_BAC].

# 8.1.2.1 Class FCS Cryptographic Support

The TOE shall meet the requirement "Cryptographic key generation (FCS\_CKM.1)" as specified below (Common Criteria Part 2). The iterations are caused by different cryptographic key generation algorithms to be implemented and key to be generated by the TOE.

### FCS\_CKM.1/DH\_PACE Cryptographic key generation - Diffie-Hellman for PACE session keys

Hierarchical to: No other components.

Dependencies: [FCS\_CKM.2 Cryptographic key distribution or FCS\_COP.1 Cryptographic

operation]: fulfilled by FCS\_COP.1/PACE\_ENC, FCS\_COP.1/PACE\_MAC

and FCS COP.1/PACE CAM

FCS\_CKM.4 Cryptographic key destruction: fulfilled by FCS\_CKM.4/PACE.

FCS\_CKM.1.1 /DH PACE

ST

The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [selection: *Diffie- Hellman-Protocol compliant to ECDH compliant to [TR-03111]*] and specified cryptographic key sizes **Table 21- column Key size** bit that meet the following: [ICAO-TR-SAC].

| Key Usage             | algorithm  | Key size  |
|-----------------------|--|---|
| /SKPICC-ECDH          | <b>ECDH Key Agreement Algorithm –</b> [IEEE-P1363]   | 160, 192, 224, 256, 320, 384, 512, and 521 bits |
| /SKPICC-DH            | <b>DH Key Agreement Algorithm –</b> [RSA Laboratories, PKCS#3: Diffie-Hellman keyagreement standard, 1993] | 1024/160, 2048/224,<br>2048/256                 |
| /TDESsession-<br>ECDH | ECDH Key Agreement Algorithm – 160, 192, 224, 256, 320, 384, 512, and 521 bits                             | 112 bits  |
| /AESsession-<br>ECDH  | ECDH Key Agreement Algorithm - 160, 192, 224, 256, 320, 384, 512, and 521 bits                             | 128, 192, 256                                   |
| /TDESsession-DH       | DH Key Agreement Algorithm – 1024, 2048 bits MODP Group with 160, 224, 256-bit Prime Order Subgroup        | 112 bits  |
| /AESsession-DH        | DH Key Agreement Algorithm – 1024, 2048 bits MODP Group with 160, 224, 256-bit Prime Order Subgroup        | 128, 192, 256                                   |

Table 21: FCS\_CKM.1/DH\_PACE iteration explanation

#### FCS CKM.1/PERSO Cryptographic key generation for Session keys

Hierarchical to: No other components

Dependencies: [FCS CKM.2 Cryptographic key distribution or

FCS COP.1 Cryptographic operation]: fulfilled by

/PERSO

FCS\_CKM.1.1 The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [assignment: cryptographic key generation algorithm] and specified cryptographic key sizes [assignment: cryptographic key

> sizes that meet the following: [assignment: list of standards].

| Key Usage | algorithm       | Key size  | standard                       |
|-----------|-----------------|---|--------------------------------|
| /GP       | GP session keys | 112, 128 bits (and 192<br>& 256 bits for SCP03) | [GP211] SCP01, SCP02, or SCP03 |

### Table 22: FCS\_CKM.1/PERSO iteration explanation

The TOE shall meet the requirement "Cryptographic key destruction (FCS CKM.4)" as specified below (Common Criteria Part 2).

### FCS\_CKM.4/PACE Cryptographic key destruction

Hierarchical to: No other components

Dependencies: [FDP\_ITC.1 Import of user data without security attributes, or

FDP ITC.2 Import of user data with security attributes, or

FCS\_CKM.1 Cryptographic key generation]: fulfilled by FCS\_CKM.1/DH PACE

and FCS CKM.1/PERSO.

FCS\_CKM.4.1 The TSF shall destroy cryptographic keys in accordance with a specified

PACE cryptographic key destruction method Secure erasing of the value by

overwriting the data with random numbers that meets the following: None.

### FCS\_COP.1/PACE\_ENC Cryptographic operation - Encryption / Decryption AES / 3DES

Hierarchical to: No other components.

Dependencies: [FDP\_ITC.1 Import of user data without security attributes, or

FDP\_ITC.2 Import of user data with security attributes, or FCS\_CKM.1 Cryptographic key generation]: fulfilled by

FCS CKM.1/DH PACE FCS CKM.4 Cryptographic key destruction: fulfilled

by FCS CKM.4/PACE.

FCS COP.1.1 /PACE ENC

ST

The TSF shall perform secure messaging - encryption and decryption in accordance with a specified cryptographic algorithm Table 23 algorithm

and cryptographic key sizes Table 23 Key size that meet the following:

Table 23 - list of standards.

| Algorithm type | algorithm        | Key size         | List of standards |
|----------------|------------------|------------------|-------------------|
| /ENC_TDES      | TDES in CBC mode | 112 bits         | ISO 10116         |
| /ENC_AES       | AES in CBC mode  | 128, 192,<br>256 | ISO 10116         |

Table 23: FCS\_COP.1/PACE\_ENC iteration explanation

### FCS\_COP.1/PACE\_MAC Cryptographic operation - MAC

Hierarchical to: No other components.

Dependencies: [FDP ITC.1 Import of user data without security attributes, or

FDP\_ITC.2 Import of user data with security attributes, or

FCS\_CKM.1 Cryptographic key generation]: fulfilled by FCS\_CKM.1/DH\_PACE FCS\_CKM.4 Cryptographic key destruction: fulfilled by FCS\_CKM.4/PACE.

FCS\_COP.1.1 /PACE\_MAC

The TSF shall perform <u>secure messaging – message authentication code</u> in accordance with a specified cryptographic algorithm **Table 24 - algorithm** and

cryptographic key sizes Table 24 - Key size that meet the following: compliant to

[ICAO-TR-SAC].

| Algorithm explanation | algorithm       | Key size      | List of standards |
|-----------------------|-----------------|---------------|-------------------|
| /MAC_TDES             | TDES Retail MAC | 112 bits      | ISO 9797-1        |
| /MAC_AES              | AES CMAC        | 128, 192, 256 | [NIST-800-38B]    |

Table 24: FCS COP.1/PACE MAC iteration explanation

#### FCS COP.1/PACE CAM Cryptographic operation - Modular Multiplication

Hierarchical to: No other components.

Dependencies: [FCS\_CKM.1 Cryptographic key generation]: fulfilled by FCS\_CKM.1/DH\_PACE

FCS\_CKM.4 Cryptographic key destruction: fulfilled by FCS\_CKM.4/PACE.

FCS\_COP.1.1 The TSF shall perform modular multiplication with specify cryptography algorithm /PACE\_CAM and cryptographic key sizes as in Table 25 Key size that meet the following:

compliant to: [TR03110-1]

| Algorithm type | algorithm | Key size                               |
|----------------|-----------|--|
| /CAM ECDH      | ECC       | 160, 192, 224, 256, 320, 384, 512, 521 |

Table 25: FCS COP.1/PACE CAM iteration explanation

| FCS_COP.1/PERSO | Cryptographic | operation | - | Symmetric | encryption, | decryption, | and | MAC | during |
|-----------------|---------------|-----------|---|-----------|-------------|-------------|-----|-----|--------|
| manufacturing   |               |           |   |           |             |             |     |     |        |

Hierarchical to: No other components.

Dependencies: [FDP ITC.1 Import of user data without security attributes, or

FDP\_ITC.2 Import of user data with security attributes, or.

FCS\_CKM.1 Cryptographic key generation]: fulfilled by FCS\_CKM.1/PERSO FCS\_CKM.4 Cryptographic key destruction: fulfilled by FCS\_CKM.4/PACE.

FCS\_COP.1.1

ST

/PERSO accor

The TSF shall perform symmetric encryption and decryption in accordance with a specified cryptographic algorithm Triple-DES, AES and cryptographic key sizes [Table 26] that meet the following: [Table 26]

Algorithm type algorithm Key size List of standards /ENC\_TDES **TDES encryption and decryption 112 bits** [SP 800-67] /ENC\_AES **AES** encryption and decryption 128, 192, 256 [FIPS 197] /MAC\_TDES **TDES Retail MAC** 112 bits ISO 9797-1 /MAC AES **AES CMAC** 128, 192, 256 [NIST-800-38B]

Table 26: FCS\_COP.1/PERSO iteration explanation

### FCS\_RNG.1/PACE Quality metric for random numbers

Hierarchical to: No other components Dependencies: No dependencies

FCS\_RNG.1.1 /PACE The TSF shall provide a **hybrid deterministic** random number generator that

implements:

(DRG.4.1) The internal state of the RNG shall use PTRNG of class PTG.2 as

random source.

(DRG.4.2) The RNG provides forward secrecy.

(DRG.4.3) The RNG provides backward secrecy even if the current internal

state is known.

(DRG.4.4) The RNG provides enhanced forward secrecy after calling the reseed function that acts as a refreshing done at each random generation. (DRG.4.5) The internal state of the RNG is seeded by an internal entropy

source, PTRNG of class PTG.2

FCS\_RNG.1.2 /PACE

ST

The TSF shall provide random numbers that meet:

RGS [RGS-B1] and [AIS31] DRG3 & DRG4.

(DRG.4.6) The RNG generates output for which 2^35 strings of bit length 128

are mutually different with probability equal to  $(1 - 1/2^58)$ .

(DRG.4.7) Statistical test suites cannot practically distinguish the random numbers from output sequences of an ideal RNG. The random numbers must

pass test procedure A.

**Application note:** This SFR requires the TOE to generate random numbers used for the authentication protocols as required by FIA UAU.4.

Regarding the structure of this SFR, even if it is related to the PACE component, the structure comes from [PP-JCSOpen].

### 8.1.2.2 Class FIA Identification and Authentication

Table 27 provides an overview on the authentication mechanisms used.

| Name  | SFR for the TOE |
|---|-----------------|
| Authentication Mechanism for Pre-personalisation Agents | FIA_UAU.1/PERSO |
|   | FIA_AFL.1/PERSO |
| Authentication Mechanism for Personalisation Agents     | FIA_UAU.4/PACE  |
| Chip Authentication Protocol v.1                        | FIA_UAU.5/PACE  |
| Terminal Authentication Protocol v.1                    | FIA_UAU.5/PACE  |
| PACE protocol   | FIA_UAU.1/PACE  |
|   | FIA_UAU.5/PACE  |
|   | FIA_AFL.1/PACE  |
| Passive Authentication                                  | FIA_UAU.5/PACE  |

Table 27: Overview on authentication SFR

#### FIA AFL.1/PERSO Authentication failure handling during pre-personalization and personalization phases

Hierarchical to: No other components.

Dependencies: FIA\_UAU.1 Timing of authentication: fulfilled by FIA\_UAU.1/PERSO

FIA\_AFL.1.1 The TSF shall detect when [Number in Table 28] unsuccessful /Perso authentication attempts occurs related to authentication attempts

[defined in Table 28].

FIA\_AFL.1.2 When the defined number of unsuccessful authentication attempts has

/Perso been met, the TSF shall [Actions in Table 28].

| Auth type | Number | Actions                  | Authentication attempts from |
|-----------|--------|--------------------------|------------------------------|
| GP        | 3      | Block GP authentication. | GP Authentication key        |

#### Table 28: FIA AFL.1/PERSO refinements

#### FIA\_AFL.1/PACE Authentication failure handling – PACE authentication using non-blocking authorisation data

Hierarchical to: No other components.

ST

Dependencies: FIA\_UAU.1 Timing of authentication: fulfilled by FIA\_UAU.1/PACE

FIA\_AFL.1.1 The TSF shall detect when [Number in Table 29] unsuccessful authentication attempt occurs related to [Authentication events].

FIA\_AFL.1.2 When the defined number of unsuccessful authentication attempts

/PACE has been met, the TSF shall [Actions in Table 29].

| Password  | Number   | Authentication events   | Actions  |
|-----------|--|---|--|
| MRZ, CAN  | 1  | authentication attempts using the PACE password (MRZ, CAN) as shared password   | Exponentially increase time delay before new authentication attempt is possible. |
| PIN & PUK | An administrator configurable positive integer linked to the size of the PIN or PUK (respectively) | Consecutive failed authentication attempts using the PIN or PUK as the shared password for PACE leaving a single authentication attempt | Suspend the PIN or the PUK   |
|           | 1  | On suspend mode, a bad or correct value presentation attempts using the PIN or PUK as the shared password for PACE                      | Suspend the PIN or the PUK   |
|           | 1  | On suspend mode, After a PACE_CAN authentication, a bad PIN/PUK value presentation attempt.   | Block the PIN or the PUK   |

Table 29: FIA\_AFL.1/PACE refinements

### FIA\_UID.1/PERSO Timing of identification

Hierarchical to: No other components.
Dependencies: No dependencies.
FIA UID.1.1 The TSF shall allow

/PERSO 1. to establish a communication channel,

2. to carry out the mutual authentication Protocol according to [GP] on behalf of the user to be performed before the user is identified.

FIA\_UID.1.2 The TSF shall require each user to be successfully identified before allowing

/PERSO any other TSF-mediated actions on behalf of that user.

### FIA\_UAU.1/PERSO Timing of authentication

Hierarchical to: No other components.

Dependencies: FIA\_UID.1 Timing of identification: fulfilled by FIA\_UID.1/PERSO

FIA\_UAU.1.1 The TSF shall allow

/PERSO 1. to establish a communication channel,

2. to carry out the mutual authentication Protocol according to [GP] on behalf of the user to be performed before the user is

authenticated.

FIA\_UAU.1.2 The TSF shall require each user to be successfully authenticated before

/PERSO allowing any other TSF-mediated actions on behalf of that user.

Application note: FIA\_AFL.1/PERSO, FIA\_UID.1/PERSO, and FIA\_UID.1/PERSO are extensions to [PP-EAC2], in order to deal with identification and authentication in pre-personalisation and personalisation phases.

### FIA\_UID.1/PACE Timing of identification

Hierarchical to: No other components Dependencies: No dependencies

FIA UID.1.1 The TSF shall allow

/PACE 1. to establish the communication channel,

- carrying out the PACE Protocol according to [ICAO-TR-SAC],
- 3. to read the Initialization Data if it is not disabled by TSF according to

FMT\_MTD.1/INI\_DIS

4. to identify themselves by selection of the authentication key.

on behalf of the user to be performed before the user is authenticated.

FIA\_UID.1.2 The TSF shall require each user to be successfully identified before allowing any other

/PACE TSFmediated actions on behalf of that user.

ST

### FIA\_UAU.1/PACE Timing of authentication

Hierarchical to: No other components

Dependencies: FIA\_UID.1 Timing of identification: fulfilled by FIA\_UID.1/PACE

FIA UAU.1.1 The TSF shall allow

/PACE

- 1. to establish the communication channel,
- 2. carrying out the PACE Protocol according to [ICAO-TR-SAC],
- 3. to read the Initialization Data if it is not disabled by TSF according to FMT MTD.1/INI DIS
- 4. to identify themselves by selection of the authentication key.

on behalf of the user to be performed before the user is authenticated.

FIA\_UAU.1.2 The TSF shall require each user to be successfully authenticated before allowing

/PACE any other TSF-mediated actions on behalf of that user.

# FIA\_UAU.4/PACE Single-use authentication mechanisms - Single-use authentication of the Terminal by the TOE

Hierarchical to: No other components Dependencies: No dependencies

FIA\_UAU.4.1 The TSF shall prevent reuse of authentication data related to

/PACE 1. PACE Protocol according to [ICAO-TR-SAC],

- 2. Authentication Mechanism based on Triple-DES, AES
- 3. Terminal Authentication Protocol v.1 according to [TR-EAC]

**Application note:** The authentication mechanisms use a challenge freshly and randomly generated by the TOE to prevent reuse of a response generated by a terminal in a successful authentication attempt.

# FIA\_UAU.5/PACE Multiple authentication mechanisms

Hierarchical to: No other components Dependencies: No dependencies

FIA\_UAU.5.1

The TSF shall provide

/PACE

ST

- 1. PACE Protocol according to [ICAO-TR-SAC],
- 2. <u>Secure messaging in MAC-ENC according to [ICAO-TR-SAC],</u> 3. <u>Symmetric Authentication Mechanism based on **Triple-DES, AES** to support user authentication.</u>

FIA\_UAU.5.2 /PACE The TSF shall authenticate any user's claimed identity according to the following rules:

- 1. TOE accepts the authentication attempt as Pre-personalization Agent by the Symmetric Authentication Mechanism with the Pre-personalization Agent Key.
- 2. Having successfully run the PACE protocol the TOE accepts only received commands with correct message authentication code sent by means of secure messaging with the key agreed with the terminal by means of the PACE protocol.
- 3. The TOE accepts the authentication attempt as Personalization Agent by the Symmetric Authentication Mechanism with Personalization Agent Key.

#### FIA UAU.6/PACE Re-authenticating - Re-authenticating of Terminal by the TOE

Hierarchical to: No other components Dependencies: No dependencies

FIA\_UAU.6.1 /PACE The TSF shall re-authenticate the user under the conditions <u>each command sent to the</u> TOE after successful run of the PACE Protocol shall be verified as being sent by the PACE

terminal.

# 8.1.2.3 Class FDP User Data Protection

The TOE shall meet the requirement "Subset access control (FDP\_ACC.1)" as specified below (Common Criteria Part 2).

# FDP\_RIP.1/PACE Subset residual information protection

Hierarchical to: No other components. Dependencies: No dependencies.

FDP\_RIP.1.1 /PACE The TSF shall ensure that any previous information content of a resource is made unavailable upon the **deallocation of the resource from** the following objects:

- 1. Session Keys (immediately after closing related communication session).
- 2. <u>ephemeral private key ephem</u> <u>SK<sub>PICC (ECDH/DH)</sub></u>- <u>PACE (by having</u> generated a DH shared secret *K* as defined in [ICAO TR]).
- 3. PIN and PUK

### 8.1.2.4 Class FTP Trusted Path/Channels

#### FTP ITC.1/PACEInter-TSF trusted channel after PACE

Hierarchical to: No other components. Dependencies: No dependencies.

FTP\_ITC.1.1 /PACE The TSF shall provide a communication channel between itself and another

trusted IT product that is logically distinct from other communication channels and provides assured identification of its end points and protection of the channel data

from modification or disclosure.

FTP\_ITC.1.2 /PACE The TSF shall permit another trusted IT product to initiate communication via the

CE trusted channel.

FTP\_ITC.1.3 /PACE

ST

The TSF shall initiate enforce communication via the trusted channel for any data

exchange between the TOE and the Terminal.

### 8.1.2.5 Class FMT Security Management

**Application note**: The SFR FMT\_SMF.1 and FMT\_SMR.1 provide basic requirements to the management of the TSF data.

The TOE shall meet the requirement "Specification of Management Functions (FMT\_SMF.1)" as specified below (Common Criteria Part 2).

#### FMT\_SMF.1/PACE Specification of Management Functions

Hierarchical to: No other components Dependencies: No dependencies

FMT\_SMF.1.1 The TSF shall be capable of performing the following management functions:

/PACE 1. Configuration.

2. Initialize, and resume the PIN or the PUK.

3. Change and unblock the PIN

### FMT\_SMF.1/PERSO Specification of Management Functions

Hierarchical to: No other components Dependencies: No dependencies

FMT\_SMF.1.1 The TSF shall be capable of performing the following management functions:

/PERSO 1. Initialization,

2. Pre-personalization3. Personalization.

The TOE shall meet the requirement "Security roles (FMT\_SMR.1)" as specified below (Common Criteria Part 2).

### FMT\_SMR.1/PACE Security roles

Hierarchical to: No other components

Dependencies: FIA\_UID.1 Timing of identification fulfilled by FIA\_UID.1/PACE

FMT\_SMR.1.1 /PACE The TSF shall maintain the roles

Terminal,

PACE authenticated BIS-PACE

FMT\_SMR.1.2 /PACE The TSF shall be able to associate users with roles.

#### FMT SMR.1/PERSO Security roles

Hierarchical to: No other components

Dependencies: FIA UID.1 Timing of identification fulfilled by FIA UID.1/PERSO

FMT\_SMR.1.1 /PERSO The TSF shall maintain the roles

Manufacturer,

Personalization Agent,

FMT SMR.1.2 /PERSO The TSF shall be able to associate users with roles.

The TOE shall meet the requirement "Limited capabilities (FMT\_LIM.1)" as specified below (Common Criteria Part 2 extended).

ST Ref: D1569436\_LITE Rev: 1.25 Page: 120 / 189

#### FMT LIM.1/PERSO Limited capabilities

Hierarchical to: No other components

Dependencies: FMT\_LIM.2 Limited capabilities: fulfilled by FMT\_LIM.2/PERSO.

FMT\_LIM.1.1 The TSF shall be designed in a manner that limits their capabilities so that in conjunction

/PERSO with "Limited availability (FMT LIM.2)" the following policy is enforced:

Deploying test features after TOE delivery do not allow

- 1. User Data to be manipulated and disclosed,
- 2. TSF data to be manipulated or disclosed,
- 3. software to be reconstructed,
- 4. <u>substantial information about construction of TSF to be gathered which may enable</u> other attacks.

The TOE shall meet the requirement "Limited availability (FMT\_LIM.2)" as specified below (Common Criteria Part 2 extended).

#### FMT\_LIM.2/PERSO Limited availability

Hierarchical to: No other components

Dependencies: FMT\_LIM.1 Limited capabilities: fulfilled by FMT\_LIM.1/PERSO

FMT\_LIM.2.1 The TSF shall be designed in a manner that limits their availability so that in conjunction

/PERSO with "Limited capabilities (FMT LIM.1)" the following policy is enforced:

Deploying Test Features after TOE Delivery does not allow

- 1.User Data to be manipulated and disclosed,
- 2.TSF data to be manipulated or disclosed,
- 3.software to be reconstructed,
- 4.substantial information about construction of TSF to be gathered which may enable other attacks

**Application note:** The term "software" in item 4 of FMT\_LIM.1.1 and FMT\_LIM.2.1 refers to both IC Dedicated and IC Embedded Software.

The TOE shall meet the requirement "Management of TSF data (FMT\_MTD.1)" as specified below (Common Criteria Part 2). The iterations address different management functions and different TSF data.

# FMT\_MTD.1/INI\_ENA Management of TSF data - Writing of Initialization Data and Pre-personalization Data

Hierarchical to: No other components

Dependencies: FMT\_SMF.1 Specification of management functions: fulfilled by FMT\_SMF.1/PERSO

FMT SMR.1 Security roles: fulfilled by FMT SMR.1/PERSO.

FMT MTD.1.1/ The TSF shall restrict the ability to write the Initialization Data and Pre-personalization

INI\_ENA Data to the Manufacturer.

ST

**Application note:** The pre-personalization Data includes but is not limited to the authentication reference data for the Personalization Agent which is the symmetric cryptographic Personalization Agent Key.

FMT\_MTD.1/INI\_DIS Management of TSF data – Disabling of Read Access to Initialization Data and Prepersonalization Data

Hierarchical to: No other components

Dependencies: FMT\_SMF.1 Specification of management functions: fulfilled by FMT\_SMF.1/PERSO

FMT SMR.1 Security roles: fulfilled by FMT SMR.1/PERSO.

FMT\_MTD.1.1/ The TSF shall restrict the ability to read out the Initialisation Data and the Pre-

personalisation INI DIS Data to the Personalisation Agent

# FMT\_MTD.1/KEY\_READ Management of TSF data - Key Read

Hierarchical to: No other components

Dependencies: FMT\_SMF.1 Specification of management functions: fulfilled by FMT\_SMF.1/PERSO

FMT SMR.1 Security roles: fulfilled by FMT SMR.1/PERSO.

FMT\_MTD.1.1/ The TSF shall restrict the ability to read the PACE passwords to none.

KEY\_READ

#### FMT MTD.1/Initialize PINPUK Management of TSF data – Initialize PIN or PUK

Hierarchical to: No other components

Dependencies: FMT\_SMF.1 Specification of management functions: fulfilled by FMT\_SMF.1/PERSO

FMT\_SMR.1 Security roles: fulfilled by FMT\_SMR.1/PERSO.

FMT\_MTD.1.1/ The TSF shall restrict the ability to <u>write</u> the initial <u>PIN and PUK</u> to <u>the personalization</u> Initialier PINPUK agent.

#### FMT\_MTD.1/Resume\_PINPUK Management of TSF data – Resuming PIN or PUK

Hierarchical to: No other components

Dependencies: FMT\_SMF.1 Specification of management functions: fulfilled by FMT\_SMF.1/PERSO

FMT SMR.1 Security roles: fulfilled by FMT SMR.1/PERSO.

FMT MTD.1.1/ The TSF shall restrict the ability to resume the suspended PIN or the PUK to the

Resume PINPUK eDigitalIdentity document holder.

### FMT\_MTD.1/Change\_PIN Management of TSF data - Changing PIN or PUK

Hierarchical to: No other components

Dependencies: FMT\_SMF.1 Specification of management functions: fulfilled by

FMT SMF.1/PERSO

FMT\_SMR.1 Security roles: fulfilled by FMT\_SMR.1/PERSO.

FMT MTD.1.1/ Change PINPUK The TSF shall restrict the ability to change the PIN to the eDigitalIdentity

document holder.

# FMT\_MTD.1/Unblock\_PIN Management of TSF data - Unblocking PIN or PUK

Hierarchical to: No other components

Dependencies: FMT\_SMF.1 Specification of management functions: fulfilled by FMT\_SMF.1/PERSO

FMT\_SMR.1 Security roles: fulfilled by FMT\_SMR.1/PERSO.

FMT\_MTD.1.1/Unblock\_PINPUK The TSF shall restrict the ability to unblock the blocked PIN to the

eDigitalIdentity document holder (using the PUK for unblocking).

ST Ref: D1569436\_LITE Rev: 1.25 Page: 122 / 189

# 8.1.2.6 Class FPT Protection of the Security Functions

The TOE shall prevent inherent and forced illicit information leakage for User Data and TSF Data. The security functional requirement FPT\_EMS.1 addresses the inherent leakage. With respect to the forced leakage they have to be considered in combination with the security functional requirements "Failure with preservation of secure state (FPT\_FLS.1)" and "TSF testing (FPT\_TST.1)" on the one hand and "Resistance to physical attack (FPT\_PHP.3)" on the other. The SFRs "Limited capabilities (FMT\_LIM.1)", "Limited availability (FMT\_LIM.2)" and "Resistance to physical attack (FPT\_PHP.3)" together with the SAR "Security architecture description" (ADV\_ARC.1) prevent bypassing, deactivation and manipulation of the security features or misuse of TOE functions. The TOE shall meet the requirement "TOE Emanation (FPT\_EMS.1)" as specified below (Common Criteria Part 2 extended):

#### **FPT\_EMS.1 TOE Emanation**

Hierarchical to: No other components Dependencies: No dependencies.

FPT\_EMS.1.1 The TOE shall not emit electromagnetic and current emissions in excess of

intelligible threshold enabling access to Personalization Agent Key(s) and

Applicative keys and sensitive data\*.

FPT\_EMS.1.2 The TSF shall ensure any users are unable to use the following interface TOE

external interfaces available according to form factor to gain access to

Personalization Agent Key(s) and Applicative keys and sensitive data\*.

Application note: When application is MTRD; <u>Applicative keys</u> are **Chip Authentication Private Key\_**and **Active Authentication Key,** and sensitive data **are EF.DG3 and EF.DG4**.

The following security functional requirements address the protection against forced illicit information leakage including physical manipulation.

The TOE shall meet the requirement "Failure with preservation of secure state (FPT\_FLS.1)" as specified below (Common Criteria Part 2).

# FPT\_FLS.1 Failure with preservation of secure state

Hierarchical to: No other components Dependencies: No dependencies.

FPT FLS.1.1 The TSF shall preserve a secure state when the following types of

failures occur: 1. Exposure to operating conditions causing a TOE malfunction, 2. failure detected by TSF according to FPT\_TST.1.

The TOE shall meet the requirement "TSF testing (FPT\_TST.1)" as specified below (Common Criteria Part 2).

#### FPT TST.1 TSF testing

Hierarchical to: No other components Dependencies: No dependencies.

FPT\_TST.1.1 The TSF shall run a suite of self-tests [see Table 30: FPT\_TST triggering conditions] to

demonstrate the correct operation of the TSF.

FPT\_TST.1.2 The TSF shall provide authorised users with the capability to verify the integrity of TSF

data.

ST

FPT\_TST.1.3 The TSF shall provide authorised users with the capability to verify the integrity of stored

TSF executable code.

| Conditions under which self-test should occur | Description of the self-test  |
|---|---|
| During initial start-up                       | RNG live test, sensor test, FA detection, Integrity Check of NVM ES |
| Periodically                                  | RNG monitoring, FA detection  |
| After cryptographic computation               | FA detection  |
| Before any use or update of TSF data          | FA detection, Integrity Check of related TSF data                   |

Table 30: FPT TST triggering conditions

The TOE shall meet the requirement "Resistance to physical attack (FPT\_PHP.3)" as specified below (Common Criteria Part 2).

### FPT\_PHP.3 Resistance to physical attack

Hierarchical to: No other components Dependencies: No dependencies.

FPT\_PHP.3.1 The TSF shall resist physical manipulation and physical probing to the TSF by responding

automatically such that the SFRs are always enforced.

### 8.1.3 Security Functional Requirements from PP Global Platform Secure Element

This chapter provides the set of Security Functional Requirements (SFRs) the TOE has to enforce in order to fulfil the security objectives. One group of SFRs covers the Java Card System and comes from [PP-JC-OPEN] (see section 7.1.1), while the other group of SFRs is added and covers the GlobalPlatform specification [GP23] (see subsections of section 7.1.2).

The set of underlying security functional policies is the following:

| [PP-JCS-Open] (see section 7.1.1)            | [PP-GP] (see section 7.1.2)                     | Description  |
|--|---|--|
| Firewall access control SFP                  |   | Included in this ST by reference   |
| ADEL access control SFP                      |   | Included in this ST by reference   |
| JCVM information flow control SFP            |   | Included in this ST by reference   |
| Package Loading information flow control SFP | ELF Loading information flow control SFP        | ELF Loading SFP replaces Package Loading SFP. Covers INSTALL and LOAD commands |
|  | Data & Key Loading information flow control SFP |  |

Table 31: Security Functional Policies (SFP) of the core SE PP

This group of SFRs covers the following functions:

ST

- SD and Application Life cycle management and transitions

Note: The deletion requirements for Applications and/or Executable Load Files are covered by the group 'ADELG' from [PP-JC-OPEN] and are not repeated here. The [PP-JC-OPEN] requirements are sufficient for this PP. The Card Management requirements contain seven sub-groups of SFRs identified with the following suffixes:

- /GP-ELF for SFRs belonging to the ELF Loading information flow control policy
- /GP-KL for SFRs belonging to the Data & Key Loading information flow control policy
- /GP-LC for SFRs belonging to the Life Cycle management (states and transitions)
- /GP-PR for SFRs belonging to the Privileges assignment, management and transition
- /GP-SCP for SFRs belonging to the Secure Communication Protocols (SCPs)
- /GP-TF for SFRs belonging to the Trusted Framework scheme for inter-application communication | /GP for common SFRs, mainly related to the security policies defined in /GP-ELF and /GP-KL.

### 8.1.3.1 Definition of the Users/Subjects

| S.SD   | A GlobalPlatform SD representing an off-card entity on the card. This entity can be the Issuer, an Application Provider, the Controlling Authority, or the Validation Authority.  |
|--------|---|
| S.OPEN | It represents the GlobalPlatform Environment (OPEN) on the card. The main responsibility of the S.OPEN is to provide an API to applications, command dispatch, Application selection, (optional) logical channel management, Card Content management, memory management, and Life Cycle management. S.ADEL and S.INSTALLER are parts of S.OPEN. |

Table 32: Additional Subjects Related to [GP23]

#### 8.1.3.2 ELF Loading Information Flow Control Policy

### FDP\_IFC.2/GP-ELF Complete information flow control

FDP\_IFC.2.1/GP-ELF The TSF shall enforce the ELF Loading information flow control SFP on

- Subjects: S.SD, S.CAD, S.OPEN
- Information: APDU commands INSTALL and LOAD, GlobalPlatform APIs for loading and installing ELF and all operations that cause that information to flow to and from subjects covered by the SFP.

**FDP\_IFC.2.2/GP-ELF** The TSF shall ensure that all operations that cause any information in the TOE to flow to and from any subject in the TOE are covered by an information flow control SFP.

#### Application Note:

This SFR corresponds to FDP\_IFC.2/CM of [PP-JC-OPEN]. The subject S.SD can be the ISD, an APSD, or the CASD. GlobalPlatform's card content management APDU commands and API methods are described in [GP23] Chapter 11 and Appendix A.1, respectively.

### FDP\_IFF.1/GP-ELF Complete information flow control

**FDP\_IFF.1.1/GP-ELF** The TSF shall enforce the **ELF Loading information flow control SFP** based on the following types of subject and information security attributes:

- Subjects: S.SD, S.OPEN
- Information: APDU commands INSTALL and LOAD, GlobalPlatform APIs for loading and installing ELF
- Security attributes: Card Life Cycle state, ELF signature verification status, ELF AID, SD privileges,
   Secure Channel Security Level<sup>3</sup>.

**FDP\_IFF.1.2/GP-ELF** The TSF shall permit an information flow between a controlled subject and controlled information via a controlled operation if the following rules hold:

- S.SD implements one or more Secure Channel Protocols, namely <u>SCP02, SCP03, SCP21</u><sup>4</sup>, each with a complete Secure Channel Key Set.
- S.SD has all of the cryptographic keys required by its privileges (e.g. CLFDB, DAP, DM).
- On receipt of INSTALL or LOAD commands, S.OPEN checks that the card Life Cycle State is not CARD\_LOCKED or TERMINATED.
- S.OPEN accepts an ELF only if its integrity and authenticity has been verified.
- S.OPEN accepts an ELF only if its AID is not already registered by the TSF<sup>5</sup>

FDP IFF.1.3/GP-ELF The TSF shall enforce the none<sup>6</sup>

FDP IFF.1.4/GP-ELF The TSF shall explicitly authorize an information flow based on the following rules: none7.

<sup>&</sup>lt;sup>3</sup> [assignment: list of subjects and information controlled under the indicated SFP, and for each, the security attributes]

<sup>&</sup>lt;sup>4</sup> [selection: SCP02, SCP03, SCP10, SCP11, SCP21, SCP22, SCP80, SCP81]

<sup>&</sup>lt;sup>5</sup> [assignment: for each operation, the security attribute-based relationship that must hold between subject and information security attributes]

<sup>&</sup>lt;sup>6</sup> [assignment: additional information flow control SFP rules]

<sup>&</sup>lt;sup>7</sup> [assignment: rules, based on security attributes, that explicitly authorize information flows]

FDP IFF.1.5/GP-ELF The TSF shall explicitly deny an information flow based on the following S.OPEN fails to verify the integrity and request verification of the authenticity rules: □ for ELFs 

S.OPEN fails to verify the Card Life Cycle state S.OPEN fails to verify the SD privileges.

- S.SD fails to verify the security level applied to protect INSTALL or LOAD commands.
- S.SD fails to set the security level (integrity and/or confidentiality), to apply to the next incoming command and/or next outgoing response.
- S.SD fails to unwrap INSTALL or LOAD commands.
- The ELF AID is already registered within the card8

#### Application Note:

This SFR refines and replaces FDP\_IFF.1/CM of [PP-JC-OPEN].

APDUs belonging to the policy ELF Loading information flow control SFP are described in the following references: For INSTALL, see [GP23] section 11.5.

For LOAD, see [GP23] section 11.6.

The INSTALL and LOAD commands must only be issued within a Secure Channel Session; the levels of security for these commands depend on the security level defined in the EXTERNAL AUTHENTICATE command.

The minimum security level of INSTALL and LOAD is 'AUTHENTICATED' as defined in [GP23] section 10.6.

For instance, Security attributes that can be used in FDP\_IFF.1.1/GP-ELF are the authorisation status per Card Life Cycle State information, Privileges data, and the protection security levels of messages as defined in [GP23] section 10.6: Entity authentication, Integrity and Data Origin authentication, Confidentiality.

For more details about the rules to be applied to each role of INSTALL command, refer to [GP23] sections 9.3 and 3.4.

### FDP ITC.2/GP-ELF Import of user data with security attributes

FDP\_ITC.2.1/GP-ELF The TSF shall enforce the ELF Loading information flow control SFP when importing user data, controlled under the SFP, from outside of the TOE.

FDP ITC.2.2/GP-ELF The TSF shall use the security attributes associated with the imported user data.

FDP\_ITC.2.3/GP-ELF The TSF shall ensure that the protocol used provides for the unambiguous association between the security attributes and the user data received.

FDP\_ITC.2.4/GP-ELF The TSF shall ensure that interpretation of the security attributes of the imported user data is as intended by the source of the user data.

FDP ITC.2.5/GP-ELF The TSF shall enforce the following rules when importing user data controlled under the SFP from outside the TOE:

- Referring to Java Card rules defined in [JCVM] and [JCRE]: ELF loading is allowed only if, for each dependent ELF, its AID attribute is equal to a resident ELF AID attribute, and the major (minor) Version attribute associated with the dependent ELF is less than or equal to the major (minor) Version attribute associated with the resident ELF
- None<sup>9</sup>

# Application Note:

This SFR corresponds to FDP\_ITC.2/Installer of [PP-JC-OPEN].

Java Card rules are defined in [JCVM] sections 4.4 and 4.5 and [JCRE] section 11.

The TSF shall use the INSTALL data format and the LOAD data format when interpreting the user data from outside the TOE.

<sup>8 [</sup>assignment: rules, based on security attributes, that explicitly deny information flows]

<sup>&</sup>lt;sup>9</sup> [assignment: additional importation control rules]

# 8.1.3.3 Data & Key Loading Information Flow Control Policy

#### FDP IFC.2/GP-KL Complete information flow control

FDP\_IFC.2.1/GP-KL The TSF shall enforce the Data & Key Loading information flow control SFP on

- Subjects: S.SD, S.CAD, S.OPEN, Application
- Information: GlobalPlatform APDU commands STORE DATA and PUT KEY, GlobalPlatform APIs for loading and storing data and keys

and all operations that cause that information to flow to and from subjects covered by the SFP.

**FDP\_IFC.2.2/GP-KL** The TSF shall ensure that all operations that cause any information in the TOE to flow to and from any subject in the TOE are covered by an information flow control SFP.

#### Application Note:

- GlobalPlatform's card content management APDU commands and API methods are described in [GP23] Chapter
   11 and Appendix A.1, respectively.
- The subject S.SD can be the ISD, an APSD, or the CASD.

#### FDP IFF.1/GP-KL Complete information flow control

FDP\_IFF.1.1/GP-KL The TSF shall enforce the Data & Key Loading information flow control SFP based on the following types of subject and information security attributes:

- Subjects: S.SD, S.OPEN
- GlobalPlatform APDU commands STORE DATA and PUT KEY, GlobalPlatform APIs for loading and storing data and keys
- <u>Security attributes: card Life Cycle State, Application and SD Life Cycle states, Secure Channel Security Level, SD and Application privileges<sup>10</sup>.</u>

**FDP\_IFF.1.2/GP-KL** The TSF shall permit an information flow between a controlled subject and controlled information via a controlled operation if the following rules hold:

- S.SD implements one or more Secure Channel Protocols, namely SCP02, SCP03, SCP21, each equipped with a complete Secure Channel Key Set.
- S.SD has all of the cryptographic keys required by its privileges (e.g. CLFDB, DAP, DM).
- · An Application accepts a message only if it comes from the S.SD it belongs to.
- On receipt of a request to forward STORE DATA or PUT KEY commands to an Application, S.OPEN checks that the card Life Cycle State is not CARD\_LOCKED or TERMINATED.
- On receipt of a request to forward STORE DATA or PUT KEY commands to an Application, the S.OPEN checks that the requesting S.SD has no restrictions for personalisation.
- S.SD unwraps STORE DATA or PUT KEY according to the Current Security Level of the current Secure Channel Session and prior to the command forwarding to the targeted Application or SD.
- S.OPEN verifies that the targeted application implements a personalization interface<sup>11</sup> FDP\_IFF.1.3/GP-KL The TSF shall enforce the none<sup>11</sup>.

FDP\_IFF.1.4/GP-KL The TSF shall explicitly authorise an information flow based on the following rules: none<sup>12</sup>.

FDP IFF.1.5/GP-KL The TSF shall explicitly deny an information flow based on the following rules:

- S.OPEN fails to verify the Card Life Cycle, Application and SD Life Cycle states.
- S.OPEN fails to verify the privileges belonging to an SD or an Application.
- S.SD fails to unwrap STORE DATA or PUT KEY.
- S.SD fails to verify the security level applied to protect APDU commands.

ST Ref: D1569436\_LITE Rev: 1.25 Page: 127 / 189

 <sup>10 [</sup>assignment: list of subjects and information controlled under the indicated SFP, and for each, the security attributes]
 11 [assignment: for each operation, the security attribute-based relationship that must hold between subject and information security attributes]

<sup>&</sup>lt;sup>11</sup> [assignment: additional information flow control SFP rules]

<sup>&</sup>lt;sup>12</sup> [assignment: rules, based on security attributes, that explicitly authorize information flows]

• S.SD fails to set the security level (integrity and/or confidentiality), to apply to the next incoming command and/or next outgoing response. S.OPEN fails to verify that the targeted application implements a personalization interface.<sup>13</sup>

#### Application Note:

APDUs belonging to the Data & Key Loading information flow control SFP are described in the following references:

- For PUT KEY, see [GP23] section 11.8.
- For STORE DATA, see [GP23] section 11.11.

The PUT KEY and STORE DATA commands must only be issued within a Secure Channel Session; the levels of security for these commands depend on the security level defined in the EXTERNAL AUTHENTICATE command. The minimum security level of PUT KEY and STORE DATA is 'AUTHENTICATED' as defined in [GP23] section 10.6. For instance, Security attributes that can be used in FDP\_IFF.1.1/GP-KL are the authorisation status per Card Life Cycle State information, Privileges data, and the protection security levels of messages as defined in [GP23] section 10.6: Entity authentication, Integrity and Data Origin authentication, Confidentiality.

For more details about Key Access Conditions, Data and Key Management, refer to [GP23] sections 7.5.2 and 7.6.

### FDP\_ITC.2/GP-KL Import of user data with security attributes

FDP\_ITC.2.1/GP-KL The TSF shall enforce the Data & Key Loading information flow control SFP when importing user data, controlled under the SFP, from outside of the TOE.

FDP\_ITC.2.2/GP-KL The TSF shall use the security attributes associated with the imported user data.

**FDP\_ITC.2.3/GP-KL** The TSF shall ensure that the protocol used provides for the unambiguous association between the security attributes and the user data received.

**FDP\_ITC.2.4/GP-KL** The TSF shall ensure that interpretation of the security attributes of the imported user data is as intended by the source of the user data.

**FDP\_ITC.2.5/GP-KL** The TSF shall enforce the following rules when importing user data controlled under the SFP from outside the TOE:

- The algorithms and key sizes of the imported keys shall be supported by the SE
- The Key Identifier (Key ID) of the imported keys shall be in an allowed range as specified in section 4 of [GP23 Com]<sup>14</sup>

#### Application Note:

The algorithms and key sizes of the imported keys shall be supported by the Card as specified in [GP23] Appendices B and C.

PUT KEY and STORE DATA are described in [GP23] sections 11.8 and 11.11.

<sup>&</sup>lt;sup>13</sup> [assignment: rules, based on security attributes, that explicitly deny information flows]

<sup>&</sup>lt;sup>14</sup> [assignment: additional importation control rules]

8.1.3.4 Life Cycle Management

### FMT\_MTD.1/GP-LC Management of TSF Data

FMT\_MTD.1.1/GP-LC The TSF shall restrict the ability to <u>change\_default, query</u><sup>15</sup> the <u>TSF data listed in Table 33</u><sup>16</sup> to the authorized identified roles mentioned in Table 33<sup>17</sup>.

| Operations      | List of TSF Data:                         | Authorised Identified Roles             |
|-----------------|---|---|
| (APDUs or APIs) | (Life Cycle State and Transitions)        |   |
|                 | Card Life Cycle State information         | ISD on behalf of the Issuer,            |
|                 |   | Supplementary SD (SSD) on behalf of AP  |
|                 | Application or SSD Life Cycle State       | ISD on behalf of the Issuer, AP owning  |
| Query (GET      | information                               | the corresponding SSD or Application    |
| STATUS)         | Executable Load Files Life Cycle State    | ISD on behalf of the Issuer, AP owning  |
|                 | information                               | the corresponding ELF                   |
|                 | Executable Load Files and Executable      | ISD on behalf of the Issuer, AP owning  |
|                 | Modules Life Cycle State information      | the corresponding ELF and Modules       |
|                 | Card Life Cycle State information and     | ISD on behalf of the Issuer             |
|                 | transitions as defined in [GP23]          |   |
| Change_default  | Application or SSD Life Cycle State       | AP owning the corresponding SSD or      |
| (SET STATUS)    | information and transitions as defined in | Application                             |
|                 | [GP23]                                    |   |
|                 | SD and its associated Applications Life   | AP owning the corresponding SSD and its |
|                 | Cycle State information                   | Applications                            |

Table 33: Life Cycle Management Operations, Data, and Roles

#### Application Note:

Refer to the following sections in [GP23] for additional details about Life Cycle:

- Card Life Cycle states and transitions are described in [GP23] section 5.1.
- The Executable Load File/ Executable Module Life Cycle is described in [GP23] section 5.2.
- Application and Security Domain Life Cycle states and transitions are described in [GP23] section 5.3.
- Authorised commands per Card Life Cycle state are detailed in [GP23] Table 11-1.
- The GET STATUS APDU command used to query Life Cycle state information of an ISD, Executable Load File, Executable Module. Application. or SD is described in [GP23] section 11.4.
- The SET STATUS APDU command used to change the Life Cycle state information of an ISD, Supplementary SD, or Application is described in [GP23] section 11.10.
- The minimum security level for SET STATUS and GET STATUS is 'AUTHENTICATED' as defined in [GP23] section 10.6.

<sup>&</sup>lt;sup>15</sup> [selection: change\_default, query, modify, delete, clear, [assignment: other operations]]

<sup>&</sup>lt;sup>16</sup> [assignment: list of TSF data]

<sup>&</sup>lt;sup>17</sup> [assignment: the authorized identified roles]

8.1.3.5 Privileges Management

### FMT\_MTD.1/GP-PR Management of TSF Data

# **FMT\_MTD.1.1/GP-PR** The TSF shall restrict the ability to <u>modify</u><sup>18</sup> the <u>TSF data listed in Table 34</u><sup>19</sup> to <u>the</u> <u>authorized identified roles mentioned in Table 34</u><sup>20</sup>.

| Operations             | List of TSF Data:                      | Authorised Identified Roles  |
|------------------------|--|--|
| (APDUs or APIs)        | Privileges                             |  |
| Modify<br>(INSTALL     | Privileges of an<br>Application or SSD | SD processing the command shall be an ancestor SD with the AM privilege, or an SD with DM privilege under an ancestor SD with AM privilege |
| [for registry update]) | Privileges of ISD                      | Only ISD   |

### Table 34: Privileges Management Operations, Data, and Roles

Application Note: The 'Privileges Management' requirements cover all Privileges Assignment, Management, and Transition as defined in [GP23 Com] section 3.1.1 and [GP23] section 6.6.

### 8.1.3.6 Secure Communication

The purpose of an SCP is to authenticate the on-card and off-card entities and to protect the data exchanged between them with regard to Authenticity, Integrity, and/or Confidentiality.

The Secure Communication requirements cover all SCPs defined by [GPCS et al.]:

- The symmetric key Secure Channel Protocol '03' defined in [Amd D] includes services similar to Secure Channel Protocol '02' [GP23]; however, it uses AES rather than DES cryptography.
- The asymmetric key Secure Channel Protocol '10' [GP23] offers authentication services using an RSA-based Public Key Infrastructure (PKI) and secure messaging protection of commands and responses using symmetric cryptography.
- The asymmetric key Secure Channel Protocol '11' defined in [Amd F] offers authentication services using an ECC-based Public Key Infrastructure (PKI) and secure messaging protection of commands and responses based on SCP03.
- The Secure Channel Protocol '22' defined in [Amd G] is a Secure Channel and key establishment protocol, collectively known as the Opacity Secure Channel establishment method.
- The Secure Channel Protocol '21' defined in [GP PF] Annex D enforces privacy requirements.
- The Secure Channel Protocol '80' supports the Over-The-Air security scheme defined in [TS 102 225], [TS 102 226]
- The Secure Channel Protocol '81' defined in [Amd B] supports an Over-The-Air security scheme based on the usage of both HTTP and Pre-Shared Key TLS protocols.

APDU commands belonging to SCPs are defined in the following references:

- SCP02 [GP23] Annex E
- SCP03 [Amd D] section 7
- SCP21 [GP PF] Annex D

The following references give details about the rules to be applied to SCPs:

- Rules that apply to all Secure Channel Protocols as defined in [GP23] Chapter 10.
- Rules for handling Security Levels in [GP23] section 10.6
- SCP02 protocol rules as defined in [GP23] section E.1.6
- SCP03 protocol rules as defined in [Amd D] section 5.6
- SCP21 protocol rules as defined in [GP PF] Annex D

Recommendations for appropriate cryptographic algorithms, key sizes and standards are given in [GP Crypto]. These are aligned with the recommendations issued by NIST [NIST 800-131A], SOG-IS [SOG-IS\_ACM], BSI [TR 02102] and ANSSI [ANSSI-RGS].

<sup>&</sup>lt;sup>18</sup> [selection: change\_default, query, modify, delete, clear, [assignment: other operations]]

<sup>19 [</sup>assignment: list of TSF data]

<sup>&</sup>lt;sup>20</sup> [assignment: the authorized identified roles]

#### FCS RNG.1/GP-SCP Random numbers generation

FCS\_RNG.1.1/GP-SCP The TSF shall provide a physical, non-physical true, deterministic, hybrid, hybrid deterministic] random number generator [selection: DRG.2, DRG.3, DRG.4, PTG.2, PTG.3, NTG.1] [AIS20] [AIS31] that implements: [assignment: list of security capabilities].

FCS RNG.1.2/GP-SCP The TSF shall provide random numbers that meet [assignment: a defined quality metric].

Refinement: Refer to FCS RNG.1 Random number generation

### FCS\_CKM.1/GP-SCP Cryptographic key generation

FCS\_CKM.1.1/GP-SCP The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [assignment: cryptographic key generation algorithm] and specified cryptographic key sizes [assignment: cryptographic key sizes] that meet the following: [assignment: list of standards].

#### Application Note:

- The session key generation within SCP02 is described in [GP23] section E.4.1.
- The session key generation within SCP03 is described in [Amd D] section 6.2.1..

# FCS\_COP.1/GP-SCP Cryptographic operation

FCS\_COP.1.1/GP-SCP The TSF shall perform the cryptographic operations listed in Table 35<sup>21</sup> in accordance with a specified cryptographic algorithm as listed in Table 35<sup>22</sup> and cryptographic key sizes as listed in Table 35<sup>23</sup> that meet the following: the standards listed in Table 35<sup>24</sup>.

#### Application Note:

- The ST writer should check the cryptographic operations implemented by the TOE against the GlobalPlatform Cryptographic Algorithm Recommendations [GP Crypto].
- The ST writer may define one FCS\_COP.1 for all cryptographic operations implemented by the TOE or one FCS\_COP.1 per operation or SCP.
- For instantiating the SFR, the ST writer should use the table below to select the cryptographic operations, algorithms, key sizes, and recommended standards implemented by the SE.

| SCP<br>Protocol  | Operation                          | Algorithm                                 | Key Sizes                | Recommended<br>Standards          |
|------------------|------------------------------------|---|--------------------------|-----------------------------------|
| SCP02            | MAC<br>Generation/Verification     | H-MAC, CMAC using TDES                    | 112 bits                 | [FIPS 198]                        |
| SCP02            | Symmetric Encryption/Decryption    | TDES in CBC mode                          | 112 bits                 | [NIST 800-67],<br>[NIST 800-38A]  |
| SCP02            | Key Derivation                     | HMAC-based KDF, CMAC-based KDF using TDES | 112 bits                 | [NIST 800-108],<br>[FIPS 198]     |
| SCP03            | Symmetric<br>Encryption/Decryption | AES in CBC mode                           | 128, 192, or<br>256 bits | [FIPS 197], [NIST 800-38A]        |
| SCP03            | MAC<br>Generation/Verification     | CMAC AES                                  | 128, 192, or<br>256 bits | [NIST 800-38B]                    |
| SCP03            | Key Derivation                     | CMAC-based KDF using AES                  | 128, 192, or<br>256 bits | [NIST 800-108],<br>[NIST 800-38B] |
| SCP02,<br>SCP03, | Hash Computing                     | SHA-256, SHA-384, SHA-512                 |                          | [ISO 10118-3] and [FIPS 180-4]    |

Table 35: Cryptographic Operations Covering the SCPs Defined by GP

### 8.1.3.7 Trusted Framework

#### FTP TRP.1/GP-TF Trusted Path

FTP\_TRP.1.1/GP-TF The TSF shall provide a communication path between itself and the Target Application and the Receiving SD that is logically distinct from other communication paths and provides assured identification of its end points and protection of the communicated data from modification and disclosure<sup>25</sup>.

FTP\_TRP.1.2/GP-TF The TSF shall permit the Receiving SD with the Trusted Path privilege, the Trusted Framework, and the Target Application to initiate communication via the trusted path.

FTP\_TRP.1.3/GP-TF The TSF shall require the use of the trusted path for:

 Application personalisation: the GlobalPlatform Trusted Framework for inter-application communication forwards the unwrapped command (STORE DATA) to the Target Application indicated by the Receiving SD through its GlobalPlatform Application interface.

#### 8.1.3.8 Common SFRs

#### FMT\_MSA.1/GP Management of security attributes

FMT\_MSA.1.1/GP The TSF shall enforce the ELF Loading information flow control SFP and Data & Key Loading information flow control SFP to restrict the ability to perform the operations listed in Table 36 to Table 38 acting on 26 the security attributes mentioned in Table 36 to Table 38 to Table 38 to Table 36 to Table 38 mentioned in tables Table 36 to Table 38 to

| Operations<br>(APDUs or APIs)                          | Security Attributes:<br>Card Life Cycle State   | Authorised Identified Roles with Privileges            |
|--|---|--|
| DELETE Executable Load File                            | OP_READY, INITIALIZED, or SECURED   | ISD, AM SD, DM SD                                      |
| DELETE Executable Load File and related Application(s) | OP_READY, INITIALIZED, or SECURED   | ISD, AM SD, DM SD                                      |

Table 38: SCP21 Operations, Security Attributes, and Roles

#### FMT MSA.3/GP Security attribute initialisation

**FMT\_MSA.3.1/GP** The TSF shall enforce the **ELF Loading information flow control SFP and Data & Key Loading information flow control SFP to provide <b>restrictive** default values for security attributes that are used to enforce the SFP.

**FMT\_MSA.3.2/GP** The TSF shall allow the <u>None</u><sup>29</sup> to specify alternative initial values to override the default values when an object or information is created.

#### Application Note:

This SFR refines FMT\_MSA.1/CM of [PP-JC-OPEN]. It is extended to cover Data and Key loading Policy. The authorized identified roles could be off-card or on-card entities as defined in FMT\_SMR.1/GP.

### FMT\_SMR.1/GP Security roles

FMT SMR.1.1/GP The TSF shall maintain the roles:

- · On-card: S.OPEN, S.SD (e.g. ISD, APSD, CASD), Application.
- Off-card: Issuer, Users (e.g. VA, AP, CA) owning SDs FMT\_SMR.1.2/GP The TSF shall be

able to associate users with roles.

#### Application Note:

This SFR corresponds to FMT\_SMR.1/Installer and FMT\_SMR.1/CM of [PP-JC-OPEN], applied to roles involved in card content management operations (this is why it has been renamed).

ST Ref: D1569436\_LITE Rev: 1.25 Page: 133 / 189

<sup>&</sup>lt;sup>29</sup> [assignment: authorized identified roles]

#### FMT SMF.1/GP Specification of Management Functions

FMT\_SMF.1.1/GP The TSF shall be capable of performing the following management functions specified in [GP23]:

- Card and Application Security Management as defined in [GP23]: Life Cycle, Privileges, Application/SD Locking and Unlocking, Card Locking and Unlocking, Card Termination, Application Status interrogation, Card Status Interrogation, command dispatch, Operational Velocity Checking, and Tracing and Event Logging.
- Management functions (Secure Channel Initiation/Operation/Termination) related to SCPs as defined in [GP23].

#### Application Note:

This SFR corresponds to FMT\_SMF.1/CM of [PP-JC-OPEN], applied to card content management operations (this is why it has been renamed).

Management functions related to SCPs are defined in [GP23] chapter 10.

#### FPT RCV.3/GP Automated recovery without undue loss

**FPT\_RCV.3.1/GP** When automated recovery from **none**, **see application note below** <sup>30</sup> is not possible, the TSF shall enter a maintenance mode where the ability to return to a secure state is provided.

FPT\_RCV.3.2/GP For detection of a potential loss of integrity during the transmission of an Executable Load File to the card, abortion of the installation process of an Executable Load File, or any fatal error occurred during the linking of an Executable Load File to the Executable Files already installed on the card the TSF shall ensure the return of the TOE to a secure state using automated procedures.

**FPT\_RCV.3.3/GP** The functions provided by the TSF to recover from failure or service discontinuity shall ensure that the secure initial state is restored without exceeding **the loss of the Executable Load File being loaded or installed**<sup>33</sup> for loss of TSF data or objects under the control of the TSF.

**FPT\_RCV.3.4/GP** The TSF shall provide the capability to determine the objects that were or were not capable of being recovered. *Application Note:* 

This SFR corresponds to FPT\_RCV.3/Installer of [PP-JC-OPEN], applied to card content management operations (this is why it has been renamed).

There is no maintenance mode implemented within the TOE. Recovery is always enforced automatically as stated in FPT RCV.3.2/GP

### FPT\_FLS.1/GP Failure with preservation of secure state

FPT\_FLS.1.1/GP The TSF shall preserve a secure state when the following types of failures occur:

- S.OPEN fails to load/install an Executable Load File / Application instance
- S.SD fails to load SD/Application data and keys
- S.OPEN fails to verify/change the Card Life Cycle, Application and SD Life Cycle states
- S.OPEN fails to verify the privileges belong to an SD or an Application
- S.SD fails to verify the security level applied to protect APDU commands □ None<sup>31</sup>

#### Application Note:

This SFR extends FPT\_FLS.1/Installer of [PP-JC-OPEN] to include the failures that may occur during the loading of SD/Application keys and data.

Refer to the section 11.1.5 in [JCRE] and 11.5, 11.6, 11.8, 11.11 in [GP23] for additional details.

ST Ref: D1569436\_LITE Rev: 1.25 Page: 134 / 189

<sup>&</sup>lt;sup>30</sup> [assignment: list of failures/service discontinuities during card content management operations]

<sup>&</sup>lt;sup>32</sup> [assignment: list of failures/service discontinuities during card content management operations]

<sup>33 [</sup>assignment: quantification]

<sup>31 [</sup>assignment: list of additional types of failures]

#### FPT TDC.1/GP Inter-TSF basic TSF data consistency

FPT\_TDC.1.1/GP The TSF shall provide the capability to consistently interpret ELFs, SD/Application data and keys, data used to implement a Secure Channel, None<sup>32</sup> when shared between the TSF and another trusted IT product.

FPT\_TDC.1.2/GP The TSF shall use the list of interpretation rules to be applied by the TSF when processing the INSTALL, LOAD, PUT KEY and STORE DATA commands sent to the card, None when interpreting the TSF data from another trusted IT product.

#### Application Note:

The list of interpretation rules to be applied by the TSF when processing the INSTALL, LOAD, PUT KEY, and STORE DATA commands sent to the card are defined in [GP23] sections 11.5, 11.6, 11.8, and 11.11.

#### FTP ITC.1/GP Inter-TSF trusted channel

**FTP\_ITC.1.1/GP** The TSF shall provide a communication channel between itself and another trusted IT product that is logically distinct from other communication channels and provides assured identification of its end points and protection of the channel data from modification or disclosure.

FTP ITC.1.2/GP The TSF shall permit another trusted IT product to initiate communication via the trusted channel.

FTP\_ITC.1.3/GP The TSF shall initiate communication via the trusted channel for:

- APDU commands sent to the card within a secure channel session
- · When loading/installing a new ELF on the card
- When transmitting and loading sensitive data to the card using STORE DATA or PUT KEY commands
- · When deleting ELFs, Applications or Keys
  - None<sup>34</sup>

# Application Note:

This SFR corresponds to FTP\_ITC.1/CM of [PP-JC-OPEN], applied where APDU command and response integrity and/or confidentiality protection through a secure channel are required.

#### FCO NRO.2/GP Enforced proof of origin

**FCO\_NRO.2.1/GP** The TSF shall enforce the generation of evidence of origin for transmitted **Executable Load Files**, **SD/Application data and keys** <sup>35</sup> at all times.

#### Refinement

The TSF shall be able to generate an evidence of origin at all times for 'Executable Load Files, SD/Application data and keys' received from the off-card entity (originator of transmitted data) that communicates with the card.

FCO\_NRO.2.2/GP The TSF shall be able to relate the <u>identity</u><sup>36</sup> of the originator of the information, and the <u>Executable</u> Load Files, SD/Application data and keys<sup>37</sup> of the information to which the evidence applies.

Refinement The TSF shall be able to load 'Executable Load Files, SD/Application data and keys' to the card with associated security attributes (the identity of the originator, the destination) such that the evidence of origin can be verified.

ST

<sup>32 [</sup>assignment: list of TSF data types]

<sup>&</sup>lt;sup>33</sup> [assignment: list of interpretation rules to be applied by the TSF]

<sup>&</sup>lt;sup>34</sup> [assignment: list of functions for which a trusted channel is required]

<sup>35 [</sup>assignment: list of information types]

<sup>&</sup>lt;sup>36</sup> [assignment: list of attributes]

<sup>&</sup>lt;sup>37</sup> [assignment: list of information fields]

FCO\_NRO.2.3/GP The TSF shall provide a capability to verify the evidence of origin of information to the off-card entity (recipient of the evidence of origin) who requested that verification given at the time the ELF, SD/Application data and keys are received<sup>38</sup>.

Application Note:

This SFR extends FCO\_NRO.2/CM of [PP-JC-OPEN] to cover the SD/Application data and keys transmitted and loaded to the card via STORE DATA and PUT KEY commands.

The exact limitations on the evidence of origin are implementation dependent. In most of the implementations, the card manager performs an immediate verification of the origin of the package using an electronic signature mechanism, and no evidence is kept on the card for future verifications.

#### FIA\_UID.1/GP Timing of identification

FIA\_UID.1.1/GP The TSF shall allow <u>SD selection</u>, <u>Application selection</u>, <u>initializing a Secure Channel with the card, requesting data that identifies the card or off-card entities</u><sup>39</sup> on behalf of the user to be performed before the user is identified.

**FIA\_UID.1.2/GP** The TSF shall require each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.

Application Note:

This SFR corresponds to FIA\_UID.1/CM of [PP-JC-OPEN].

The list of TSF-mediated actions is implementation-dependent, but ELF installation, SD/Application data and keys loading require user identification. For instance, the list of TSF-mediated actions may be:

- Application selection,
- Initializing a secure channel with the card,
- Requesting data that identifies the card or off-card entities.

#### FDP UIT.1/GP Basic data exchange integrity

FDP\_UIT.1.1/GP The TSF shall enforce the ELF Loading information flow control SFP and Data & Key Loading information flow control SFP to receive 40 user data in a manner protected from modification, deletion, insertion, replay errors.

**FDP\_UIT.1.2/GP** The TSF shall be able to determine on receipt of user data, whether **modification**, **deletion**, **insertion**, **replay** has occurred.

Application Note:

This SFR extends FDP\_UIT.1/CM of [PP-JC-OPEN] to cover the integrity protection of SD/Application data and keys. This SFR applies where APDU command and response integrity protection is required. For instance: INSTALL, LOAD, STORE DATA and PUT KEY commands.

#### FDP ROL.1/GP Basic rollback

FDP\_ROL.1.1/GP The TSF shall enforce ELF Loading information flow control SFP and Data & Key Loading information flow control SFP to permit the rollback of the installation, loading or removal operation on the executable files, application instances, SD/Application data and keys.

FDP ROL.1.2/GP The TSF shall permit operations to be rolled back within the boundary limit:

- Until the Executable File or application instance has been added to or removed from the applet's registry.
- Until SD/Application data or keys has been added to or removed from SD or Application.

<sup>&</sup>lt;sup>38</sup> [assignment: limitations on the evidence of origin]

<sup>&</sup>lt;sup>39</sup> [assignment: list of TSF-mediated actions]

<sup>&</sup>lt;sup>40</sup> [selection: transmit, receive]

### FDP\_UCT.1/GP Basic data exchange confidentiality

FDP\_UCT.1.1/GP The TSF shall enforce the ELF Loading information flow control SFP and Data & Key Loading information flow control SFP to receive<sup>41</sup> user data in a manner protected from unauthorised disclosure.

Application Note:

This SFR applies where APDU command and response confidentiality protection is required. For example, the sensitive data (e.g. secret keys) shall always be transmitted as confidential data.

FPR UNO.1/GP Unobservability

FPR\_UNO.1.1/GP The TSF shall ensure that SDs and Applications are unable to observe the operation: keys or data import (PUT KEY or STORE DATA), encryption, decryption, signature generation and verification, none<sup>42</sup> on keys and data by the OPEN or any other SD or Application.

#### FIA\_UAU.1/GP Timing of authentication

- **FIA\_UAU.1.1/GP** The TSF shall allow **the TSF mediated actions listed in FIA\_UID.1/GP** on behalf of the user to be performed before the user is authenticated.
- **FIA\_UAU.1.2/GP** The TSF shall require each user to be successfully authenticated before allowing any other TSF mediated actions on behalf of that user.

#### FIA UAU.4/GP Single-use authentication mechanisms

**FIA\_UAU.4.1/GP** The TSF shall prevent reuse of authentication data related to **the authentication mechanism used to open a secure communication channel with the card**.

#### FIA\_AFL.1/GP Authentication failure handling

- **FIA\_AFL.1.1/GP** The TSF shall detect when  $\underline{1}^{43}$  unsuccessful authentication attempts occur related to the authentication of the origin of a card management operation command.
- **FIA\_AFL.1.2/GP** When the defined number of unsuccessful authentication attempts has been **met or surpassed**, the TSF shall **close the Secure Channel**.

#### FMT MTD.3/GP Secure TSF Data

FMT\_MTD.3.1/GP The TSF shall ensure that only secure values are accepted for Life Cycle states, Security Levels and Privileges in the GlobalPlatform Registry.

8.1.3.9 Security Functional Requirements for Package 'Cardholder Verification Method (CVM)'

#### FIA AFL.1/GP-CVM Authentication failure handling

**FIA\_AFL.1.1/GP-CVM** The TSF shall detect when <u>an administrator configurable positive integer within the [1127]</u> 44 unsuccessful authentication attempts occur related to **user authentication using CVM**.

**FIA\_AFL.1.2/GP-CVM** When the defined number of unsuccessful authentication attempts has been <u>met</u><sup>48</sup>, the TSF shall <u>block the usage of the Global PIN</u><sup>45</sup>.

### FPR\_UNO.1/GP-CVM Unobservability

FPR\_UNO.1.1/GP-CVM The TSF shall ensure that <u>all users and subjects</u><sup>46</sup> are unable to observe the operation comparison on Global PIN by S.OPEN<sup>47</sup>.

8.1.3.10 <u>Security Functional Requirements for Package 'Delegated Management (DM)'</u>

### FCO\_NRR.1/GP-RECEIPT Selective proof of receipt

**FCO\_NRR.1.1/GP-RECEIPT** The TSF shall be able to generate evidence of receipt for received **card management operation requests** at the request of the **originator**.

**FCO\_NRR.1.2/GP-RECEIPT** The TSF shall be able to relate the **Confirmation Data** of the recipient of the information, and the parameters of **the card management operation request** of the information to which the evidence applies.

**FCO\_NRR.1.3/GP-RECEIPT** The TSF shall provide a capability to verify the evidence of receipt of information to **recipient** given **none**.

**Application Note:** 

- The confirmation data are described in [GP23] section 11.1.6.
- The parameters of the card management operation request are described in [GP23] section C.5.

#### FCO NRO.2/GP-TOKEN Enforced proof of origin

**FCO\_NRO.2.1/GP-TOKEN** The TSF shall enforce the generation of evidence of origin for transmitted <u>'ELF with</u> **Token Verification', as mentioned in the refinement below**<sup>48</sup> at all times.

Refinement: The TSF shall be able to generate an evidence of origin at all times for 'ELF with Token Verification' received from the off-card entity (originator of transmitted data) that communicates with the card.

FCO\_NRO.2.2/GP-TOKEN The TSF shall be able to relate the <u>token present in the card management</u> <u>operation request, as mentioned in the refinement below</u> 49 of the originator of the information, and the <u>token present in the card management operation request, as mentioned in the refinement below</u> 50 of the information to which the evidence applies. Refinement: the TSF shall be able to load 'ELF with Token Verification' to the card with associated security attributes (token present in the card management operation request) such that the authenticity of transmitted data can be verified.

ST

<sup>&</sup>lt;sup>44</sup> [selection: [assignment: positive integer number], an administrator configurable positive integer within [assignment: range of acceptable values]]

<sup>&</sup>lt;sup>48</sup> [selection: met, surpassed]

<sup>&</sup>lt;sup>45</sup> [assignment: list of actions]

<sup>49 [</sup>assignment: list of attributes]

<sup>&</sup>lt;sup>50</sup> [assignment: list of attributes]

FCO\_NRO.2.3/GP-TOKEN The TSF shall provide a capability to verify the evidence of origin of information to the off-card entity (recipient of the evidence of origin) requesting that verification given at the time the ELF with Token is received.

Application Note: the parameters of the card management operation request are described in [GP23] section C.4.

#### FCS\_COP.1/GP-TOKEN Cryptographic operation

FCS\_COP.1.1/GP-TOKEN The TSF shall perform the verification of the Token signature attached to card management commands in accordance with a specified cryptographic algorithm <u>as mentioned in Table 39</u><sup>51</sup> and cryptographic key sizes <u>as mentioned in Table 39</u>: <u>Algorithms Used to Verify the Token Signature</u> that meet the following: <u>standards mentioned in Table 39</u><sup>52</sup>.

| Algorithm | Key sizes             | Recommended Standards                                |
|-----------|-----------------------|--|

<sup>58 [</sup>assignment: list of standards]

#### FCS COP.1/GP-DAP VER Cryptographic operation

FCS\_COP.1.1/GP-DAP\_VER The TSF shall perform verification of the DAP signature attached to Load Files in accordance with a specified cryptographic algorithm <u>as mentioned in Table 41</u>59 and cryptographic key sizes <u>as mentioned in Table 41</u>60 that meet the following: <u>standards mentioned in Table 41</u>61.

| Algorithm | Key sizes             | Recommended Standards |
|-----------|-----------------------|-----------------------|
| TDES      | 112 bits              | [ISO 9797-1]          |
| AES       | 128, 192, or 256 bits | [NIST 800-38B]        |
| RSA       | 1024 or 4096 bits     | [PKCS#1]              |

Table 41: Algorithms Used to Verify the DAP Signature

Application Note: refer to the description in [GP23] section C.3 for more details.

### FCO\_NRO.2/GP-DAP Enforced proof of origin

FCO\_NRO.2.1/GP-DAP The TSF shall enforce the generation of evidence of origin for transmitted <u>'ELF with DAP', as</u> mentioned in the refinement below 62 at all times.

Refinement: the TSF shall be able to generate an evidence of origin at all times for 'ELF with DAP' received from the off-card entity (originator of transmitted data) that communicates with the card.

FCO\_NRO.2.2/GP-DAP The TSF shall be able to relate the <u>Load File Data Block Signature</u>, as mentioned in the <u>refinement below</u><sup>63</sup> of the originator of the information, and the <u>'ELF with DAP'</u>, as mentioned in the refinement below<sup>64</sup> of the information to which the evidence applies.

Refinement: the TSF shall be able to load 'ELF with DAP' to the card with associated security attributes (Load File Data Block Signature) such that the integrity and authenticity of transmitted data can be verified.

FCO\_NRO.2.3/GP-DAP The TSF shall provide a capability to verify the evidence of origin of information to the off-card entity (recipient of the evidence of origin) who requested that verification given at the time the ELF with DAP is received.

Application Note: this SFR addresses the DAP verification as defined in [GP23] sections 9.2.1, 11.6.2.3, and C.3.

# 8.1.3.12 <u>Security Functional Requirements for Patch Management</u>

#### FMT SMR.1/OS-UPDATE Security roles

FMT SMR.1.1/OS-UPDATE The TSF shall maintain the roles OS Developer, Issuer.

FMT SMR.1.2/OS-UPDATE The TSF shall be able to associate users with role

#### FMT\_SMF.1/OS-UPDATE Specification of Management Functions

**FMT\_SMF.1.1/OS-UPDATE** The TSF shall be capable of performing the following management functions: **activation** of additional code.

Application Note:

ST

Once verified and installed, additional code is become immediately effective.

<sup>&</sup>lt;sup>59</sup> [assignment: cryptographic algorithm]

<sup>60 [</sup>assignment: cryptographic key sizes]

<sup>&</sup>lt;sup>61</sup> [assignment: list of standards]

<sup>62 [</sup>assignment: list of information types]

<sup>63 [</sup>assignment: list of attributes]

<sup>64 [</sup>assignment: list of attributes]

#### FIA ATD.1/OS-UPDATE User attribute definition

**FIA\_ATD.1.1/OS-UPDATE** The TSF shall maintain the following list of security attributes belonging to individual users: additional code ID for each activated additional code.

Refinement: "Individual users" stands for additional code.

#### FDP ACC.1/OS-UPDATE Subset access control

FDP\_ACC.1.1/OS-UPDATE The TSF shall enforce the OS Update Access Control Policy on the following list of subjects, objects and operations:

- Subjects: S.OS-Developer is the representative of the OS Developer within the TOE, who responsible
  for verifying the signature and decrypting the additional code before authorizing its loading, installation
  and activation, [None]
- · Objects: additional code and associated cryptographic signature
- Operations: loading, installation and activation of additional code

#### FDP\_ACF.1/OS-UPDATE Security attribute based access control

FDP\_ACF.1.1/OS-UPDATE The TSF shall enforce the OS Update Access Control Policy to objects based on the following:

- Security Attributes:
  - The additional code cryptographic signature verification status
  - The Identification Data verification status (between the Initial TOE and the additional code)

**FDP\_ACF.1.2/OS-UPDATE** The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:

- The verification of the additional code cryptographic signature (using D.OS-UPDATE\_SGNVER-KEY) by S.OS-Developer is successful.
- The decryption of the additional code prior installation (using D.OS-UPDATE\_DEC-KEY) by S.OSDeveloper is successful.
- The comparison between the identification data of both the Initial TOE and the additional code demonstrates that the OS Update operation can be performed.
- [None]<sup>65</sup>

FDP\_ACF.1.3/OS-UPDATE The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: [None]<sup>66</sup>.

**FDP\_ACF.1.4/OS-UPDATE** The TSF shall explicitly deny access of subjects to objects based on the following additional rules: **[None]**<sup>67</sup>.

#### Application Note:

Identification data verification is necessary to ensure that the received additional code is actually targeting the TOE and that its version is compatible with the TOE version.

Confidentiality protection must be enforced when the additional code is transmitted to the TOE for loading (See OE.OS-UPDATE-ENCRYPTION). Confidentiality protection can be achieved either through direct encryption of the additional code, or by means of a trusted path ensuring the confidentiality of the communication to the TOE.

ST Ref: D1569436\_LITE Rev: 1.25 Page: 141 / 189

<sup>&</sup>lt;sup>65</sup> [assignment: rules governing access among controlled subjects and controlled objects using controlled operations on controlled objects]

<sup>66 [</sup>assignment: rules, based on security attributes, that explicitly authorize access of subjects to objects]

<sup>&</sup>lt;sup>67</sup> [assignment: rules, based on security attributes, that explicitly deny access of subjects to objects]

#### FMT MSA.3/OS-UPDATE Security attribute initialisation

**FMT\_MSA.3.1/OS-UPDATE** The TSF shall enforce the **OS Update Access Control Policy** to provide **restrictive** default values for security attributes that are used to enforce the SFP.

**FMT\_MSA.3.2/OS-UPDATE** The TSF shall allow the **OS Developer** to specify alternative initial values to override the default values when an object or information is created.

#### Application Note:

The additional code signature verification status must be set to "Fail" by default, therefore preventing any additional code from being installed until the additional code signature is actually successfully verified by the TOE.

#### FTP TRP.1/OS-UPDATE Trusted Path

**FTP\_TRP.1.1/OS-UPDATE** The TSF shall provide a communication path between itself and **remote** that is logically distinct from other communication paths and provides assured identification of its end points and protection of the communicated data from **[none]**<sup>68</sup>.

FTP\_TRP.1.2/OS-UPDATE The TSF shall permit remote users to initiate communication via the trusted path.

FTP\_TRP.1.3/OS-UPDATE The TSF shall require the use of the trusted path for the transfer of the additional code to the TOE.

#### Application Note:

During the transmission of the additional code to the TOE for loading the confidentiality shall be ensured either through direct encryption of the additional code, or by means of a trusted path ensuring the confidentiality of the communication to the TOE.

In case that the additional code is encrypted independently of the trusted path the ST writer can select 'none' in FTP TRP.1.1/OS-UPDATE.

Otherwise, the trusted path shall ensure the confidentiality of the transmitted additional code. In this case the ST writer shall select 'disclosure' in FTP\_TRP.1.1/OS-UPDATE.

### FCS COP.1/OS-UPDATE-DEC Cryptographic operation

FCS\_COP.1.1/OS-UPDATE-DEC The TSF shall perform Decryption of the additional code prior installation in accordance with a specified cryptographic algorithm [AES-CBC]<sup>69</sup> and cryptographic key sizes [AES-256]<sup>70</sup> that meet the following: [assignment: AES-CBC ISO9797-M2 NIST SP800-38A]<sup>71</sup>.

#### FCS\_COP.1/OS-UPDATE-VER Cryptographic operation

FCS\_COP.1.1/OS-UPDATE-VER The TSF shall perform digital signature verification of the additional code to be loaded in accordance with a specified cryptographic algorithm [AES-CMAC]<sup>72</sup> and cryptographic key sizes [AES256]<sup>73</sup> that meet the following: [NIST SP800-38B]<sup>74</sup>.

<sup>68 [</sup>selection: disclosure, none]

<sup>69 [</sup>assignment: cryptographic algorithm]

<sup>70 [</sup>assignment: cryptographic key sizes]

<sup>71 [</sup>assignment: list of standards]

<sup>&</sup>lt;sup>72</sup> [assignment: cryptographic algorithm]

<sup>&</sup>lt;sup>73</sup> [assignment: cryptographic key sizes]

<sup>74 [</sup>assignment: list of standards]

#### FPT FLS.1/OS-UPDATE Failure with preservation of secure state

**FPT\_FLS.1.1/OS-UPDATE** The TSF shall preserve a secure state when the following types of failures occur: interruption or incident which prevents the forming of the Updated TOE.

#### Application Note:

The OS Update operation must be either successful, or fail securely. The TOE code and identification data must be updated in an atomic way in order to always be consistent. In case of interruption or incident during the OS Update operation, the OS Developer may choose to implement any technical behavior, provided that the TOE remains in a secure state, for example by canceling the operation (the TOE remains the Initial TOE) or entering an error state, and consistency is maintained between the TOE code and the ID data.

The ST writer shall describe the "secure state" to which the OS update might lead.

- The OS Update operation must either be successful or fail securely. There are 3 steps in an OS Update operation:
  - o step 1: loading
  - o step 2: activation
  - step 3: update of TOE identification data

Steps 2 and 3 are performed atomically, so that the TOE active code and identification data always remain consistent.

- If a failure (interruption or incident) occurs during step 1 (loading), then the TOE remains in its initial state (no update, neither of code nor of the TOE identification data).
- If a failure (interruption or incident) occurs during the atomic sequence step 2 / step 3 (activation / update of TOE identification data), then the enforced behavior depends on the nature of the update:
  - o For java code updates, the TOE remains in its initial state and the OS Update operation is aborted.
  - For native code updates, the TOE does some retries to complete the atomic sequence step 2 / step 3
     (activation / update of TOE identification data) until it is successful.
  - In any case, only two possible secure states are possible at any given time:
- Either activation is not done and the TOE identification data is not updated (i.e. initial state)
- Or the atomic sequence completes successfully, i.e. the OS update is activated and the TOE
- identification data is updated accordingly.

ST

# MultiApp V5.1: GP-SE Security Target

# 8.2 SECURITY ASSURANCE REQUIREMENTS

The security assurance requirement level is EAL6 augmented with ALC\_FLR.2.

The list of all the security assurance requirements for this security target is defined in the Table 42: Assurance Level 6 (EAL6)".

The entry "EAL6" means that this requirement is defined in the CC part 5

The entry "EAL6/PP" means that requirement is defined in both [CC-3] part and in [PP-JCS-Open] (or linked)

The entry "ST" means that the requirement is defined in this security target.

| SAR                           | Title   | Required by |

| AVA: Vulnerability assessment | AVA_VAN.5 Advanced methodical vulnerability analysis                                      | EAL6        |

Table 42: Assurance Level 6 (EAL6)

Among the set of assurance components chosen for EAL6, the assignment appears only in ADV\_SPM.1. The assignment used in ADV\_SPM.1 is defined as follows:

ADV\_SPM.1 Formal TOE security policy model

Dependencies: ADV\_FSP.4

Developer action elements:

ST

ADV\_SPM.1.1D The developer shall provide a formal security policy model for the Virtual Machine Access Policy:

- Access Control Policy: FDP\_ACC.2/FIREWALL, FDP\_ACF.1/FIREWALL
- Flow control: FDP IFC.1/JCVM, FDP IFF.1/JCVM
- Security Attributes: FMT\_MSA.1/JCRE, FMT\_MSA.1/JCVM, FMT\_MSA.2/FIREWALL\_JCVM, FMT\_MSA.3/FIREWALL, FMT\_MSA.3/JCVM
- Security roles: FMT\_SMR.1/JCRE
- Management Functions: FMT\_SMF.1/CORE\_LC
- TSF Data: FMT\_MTD.1/JCRE

Note: For this formal modelisation, we focus on JCVM opcode processing. The Applet Install, Delete and APIs are out the scope of this modelisation. The initial settings (the Selected Applet Context and the initial active applet) are also out of the scope because done before the JCVM entering (selection of the applet)

Note: For this formal modelisation, the SPM scope will be considering one VM execution

| ADV_SPM.1.2D | For each policy covered by the formal security policy model, the model shall identify |
|--------------|---|
|              | the relevant portions of the statement of SFRs that make up that policy.              |
| ADV_SPM.1.3D | The developer shall provide a formal proof of correspondence between the model and    |
|              | any formal functional specification.  |
| ADV_SPM.1.4D | The developer shall provide a demonstration of correspondence between the model       |
|              | and the functional specification.   |

The SFR FMT\_MSA.1/ADEL, FMT\_MSA.3/ADEL, FMT\_SMR.1/ADEL, FMT\_SMF.1/ADEL, FMT\_MSA.1/CM, FMT\_MSA.3/CM, FMT\_SMR.1/CM, FMT\_SMF.1/CM, FDP\_ITC.2/Installer, FMT\_SMR.1/Installer, FMT\_SMR.1, FMT\_SMF.1, are out of the scope of the SPM as they are linked to the applet loading or deletion that is out of scope of the SPM boundaries limited to VM opcodes

The SFR FMT\_MTD.3/JCRE is out of scope of the SPM modelisation because AID registry is created during loading phase, which is also out of scope of the SPM (Hypothesis 2 of the SPM document [MAV51 SPM]).

### 8.3 SECURITY REQUIREMENTS RATIONALE

Table 45: rationale objective of PP GP SE vs. SFR

ST

### 8.3.1.1 SECURITY OBJECTIVES FOR THE TOE

#### 8.3.1.1.1 IDENTIFICATION

**O.SID** Subjects' identity is AID-based (applets, CAP files), and is met by the following SFRs: FDP\_ITC.2/Installer, FIA\_ATD.1/AID, FMT\_MSA.1/JCRE, FMT\_MSA.1/JCVM, FMT\_MSA.1/ADEL, FMT\_MSA.1/CM, FMT\_MSA.3/ADEL, FMT\_MSA.3/FIREWALL, FMT\_MSA.3/JCVM, FMT\_MSA.3/CM, FMT\_SMF.1/CM, FMT\_SMF.1/ADEL, FMT\_MTD.1/JCRE, and FMT\_MTD.3/JCRE.

Installation procedures ensure protection against forgery (the AID of an applet is under the control of the TSFs) or reuse of identities (FIA\_UID.2/AID, FIA\_USB.1/AID).

The [PP-GP] refined this rational **O.SID** with the requirements:

- FDP ITC.2/GP-ELF enforces the ELF loading information flow policy when importing ELFs.
- FDP\_ITC.2/GP-KL enforces the Data & Key information flow policy when importing keys and data.
- FMT\_MSA.1/GP and FMT\_MSA.3/GP specify security attributes enabling to: 
   o ensure the authenticity, integrity, and/or confidentiality of card management commands; 
   o enforce the TOE Life cycle management and transitions.
- FMT\_SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the belonging commands.
- FMT\_SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles enabled for sending and authenticating card management commands. These commands have to be protected with regard to integrity, authenticity, and confidentiality.
- FTP\_TRP.1/GP-TF enforce the identification of its end points thanks to a communication trusted path

#### 8.3.1.1.2 EXECUTION

ST

**O.OPERATE** The TOE is protected in various ways against applets' actions (security architecture described in ADV\_ARC.1, FPT\_TDC.1), the FIREWALL access control policy (FDP\_ACC.2/FIREWALL and FDP\_ACF.1/FIREWALL), and is able to detect and block various failures or security violations during usual working (FPT\_FLS.1/ADEL, FPT\_FLS.1/JCS, FPT\_FLS.1/ODEL, FPT\_FLS.1/GP, FAU\_ARP.1). Its security-critical parts and procedures are also protected: safe recovery from failure is ensured (FPT\_RCV.3/GP), applets' installation may be cleanly aborted (FDP\_ROL.1/FIREWALL), communication with external users and their internal subjects is wellcontrolled (FDP\_ITC.2/GP-ELF, FIA\_ATD.1/AID, FIA\_USB.1/AID) to prevent alteration of TSF data (also protected by components of the FPT class).

Almost every objective and/or functional requirement indirectly contributes to this one too. The [PP-GP] refined this rational **O.OPERATE** with the requirements:

- FPT\_FLS.1/GP requires the card to preserve a secure state when failures occur during loading/installing/deleting an Executable File / application instance.
- FPT RCV.3/GP ensures safe recovery from failure.

**O.RESOURCES** The TSFs detects stack/memory overflows during execution of applications (FAU\_ARP.1, FPT\_FLS.1/ADEL, FPT\_FLS.1/JCS, FPT\_FLS.1/ODEL, FPT\_FLS.1/GP). Failed installations are not to create memory leaks (FDP\_ROL.1/FIREWALL, FPT\_RCV.3/GP) as well. Memory management is controlled by the TSF (FMT\_MTD.1/JCRE, FMT\_MTD.3/JCRE, FMT\_SMR.1/GP, FMT\_SMR.1/JCRE, FMT\_SMF.1/CORE\_LC FMT\_SMR.1/ADEL, FMT\_SMF.1/ADEL, FMT\_SMF.1/CM, and FMT\_SMR.1/CM).

The [PP-GP] refined this rational **O.RESOURCES** with the requirements:

- FPT\_RCV.3/GP ensures safe recovery from failure.
- FMT\_SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the corresponding commands.
- FMT\_SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider and the Controlling Authority roles and specifies the authorised roles that are allowed to send and authenticate the card management commands. These commands have to be protected with regard to integrity, authenticity, and confidentiality.
- FPT\_FLS.1/GP requires the card to preserve a secure state when failures occur during loading/installing/deleting of an Executable File / application instance.

Page: 151 / 189

**O.FIREWALL** This objective is met by the FIREWALL access control policy (FDP\_ACC.2/FIREWALL and FDP\_ACF.1/FIREWALL), the JCVM information flow control policy (FDP\_IFF.1/JCVM, FDP\_IFC.1/JCVM), the functional requirement FDP\_ITC.2/GP-ELF. The functional requirements of the class FMT (FMT\_MTD.1/JCRE, FMT\_MTD.3/JCRE, FMT\_SMR.1/GP, FMT\_SMR.1/JCRE, FMT\_SMF.1/CORE\_LC, FMT\_SMR.1/ADEL, FMT\_SMF.1/ADEL, FMT\_SMF.1/GP, FMT\_MSA.1/JCVM, FMT\_MSA.1/JCVM, FMT\_MSA.3/JCVM, FMT\_MSA.3/JCVM, FMT\_MSA.3/JCVM, FMT\_MSA.1/ADEL, FMT\_MSA.3/ADEL, FMT\_MSA.1/JCRE) also indirectly contribute to meet this objective. The [PP-GP] refined this rational **O.FIREWALL** with the requirements:

- FMT\_MSA.1/GP and FMT\_MSA.3/GP specify security attributes enabling to: o ensure the authenticity, integrity, and/or confidentiality of card management commands; o enforce the TOE Life cycle management and transitions.
- FMT\_SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the belonging commands.
- FMT\_SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles enabled for sending and authenticating card management commands. These commands have to be protected with regard to integrity, authenticity and confidentiality.
- FDP\_ITC.2/GP-ELF enforces the ELF loading information flow policy when importing ELFs. 

  FDP\_ITC.2/GP-KL enforces the Data & Key information flow policy when importing keys and data.

**O.NATIVE** This security objective is covered by FDP\_ACF.1/FIREWALL: the only means to execute native code is the invocation of a Java Card API method. This objective mainly relies on the environmental objective OE. **CAP\_FILE**, which uphold the assumption A.CAP\_FILE.

**O.REALLOCATION** This security objective is satisfied by the following SFRs: FDP\_RIP.1/APDU, FDP\_RIP.1/GlobalArray, FDP\_RIP.1/bArray, FDP\_RIP.1/ABORT, FDP\_RIP.1/KEYS, FDP\_RIP.1/TRANSIENT, FDP\_RIP.1/ODEL, FDP\_RIP.1/OBJECTS, and FDP\_RIP.1/ADEL, which imposes that the contents of the re-allocated block shall always be cleared before delivering the block.

O.GLOBAL\_ARRAYS\_CONFID Only arrays can be designated as global, and the only global arrays required in the Java Card API are the APDU buffer, the global byte array input parameter (bArray) to an applet's install method and the global arrays created by the JCSystem.makeGlobalArray(...) method. The clearing requirement of these arrays is met by (FDP\_RIP.1/APDU, FDP\_RIP.1/GlobalArray and FDP\_RIP.1/bArray respectively). The JCVM information flow control policy (FDP\_IFF.1/JCVM, FDP\_IFC.1/JCVM) prevents an application from keeping a pointer to a shared buffer, which could be used to read its contents when the buffer is being used by another application.

If the TOE provides JCRMI functionality, protection of the array parameters of remotely invoked methods, which are global as well, is covered by the general initialization of method parameters (FDP\_RIP.1/ODEL, FDP\_RIP.1/OBJECTS, FDP\_RIP.1/ABORT, FDP\_RIP.1/KEYS, FDP\_RIP.1/ADEL and FDP\_RIP.1/TRANSIENT).

**O.GLOBAL\_ARRAYS\_INTEG** This objective is met by the JCVM information flow control policy (FDP\_IFF.1/JCVM, FDP\_IFC.1/JCVM), which prevents an application from keeping a pointer to the APDU buffer of the card, to the global byte array of the applet's install method or to the global arrays created by the JCSystem.makeGlobalArray(...) method. Such a pointer could be used to access and modify it when the buffer is being used by another application.

**O.ARRAY\_VIEWS\_CONFID** Array views have security attributes of temporary objects where the JCVM information flow control policy (FDP\_IFF.1/JCVM, FDP\_IFC.1/JCVM) prevents an application from storing a reference to the array view. Furthermore, array views may not have ATTR\_READABLE\_VIEW security attribute which ensures that no application can read the contents of the array view.

The confidentiality of the residual information of the array is ensured by FDP\_RIP.1/bArray.

**O.ARRAY\_VIEWS\_INTEG** Array views have security attributes of temporary objects where the JCVM information flow control policy (FDP\_IFF.1/JCVM, FDP\_IFC.1/JCVM) prevents an application from storing a reference to the array view. Furthermore, array views may not have ATTR\_WRITABLE\_VIEW security attribute which ensures that no application can alter the contents of the array view.

ST

#### 8.3.1.1.3 SERVICES

**O.ALARM** This security objective is met by FPT\_FLS.1/GP, FPT\_FLS.1/JCS, FPT\_FLS.1/ADEL, FPT\_FLS.1/ODEL which guarantee that a secure state is preserved by the TSF when failures occur, and FAU\_ARP.1 which defines TSF reaction upon detection of a potential security violation. o.Add-Functions

The [PP-GP] refined this rational **O.ALARM** with the requirements:

• FPT\_FLS.1/GP requires the card to preserve a secure state when failures occur during loading/installing/deleting an Executable File / application instance.

**O.TRANSACTION** Directly met by FDP\_ROL.1/FIREWALL, FDP\_RIP.1/ABORT, FDP\_RIP.1/ODEL, FDP\_RIP.1/APDU, FDP\_RIP.1/GlobalArray, FDP\_RIP.1/bArray, FDP\_RIP.1/KEYS, FDP\_RIP.1/ADEL, FDP\_RIP.1/TRANSIENT and FDP\_RIP.1/OBJECTS (more precisely, by the element FDP\_RIP.1.1/ABORT).

**O.CIPHER** This security objective is directly covered by FCS\_CKM.1, FCS\_CKM.2, FCS\_CKM.3, FCS\_CKM.4 and FCS\_COP.1. The SFR FPR\_UNO.1 contributes in covering this security objective and controls the observation of the cryptographic operations which may be used to disclose the keys. The [PP-GP] refined this rational **O.CIPHER** with the requirements:

- FCS CKM.1/GP-SCP specifies the algorithm, key sizes, and standards used for the generation of session keys.
- FCS\_COP.1/GP-SCP specifies the cryptographic operations and algorithms that shall be used to establish a Secure Channel to protect the card management commands.
- FCO\_NRO.2/GP-DAP generates an evidence of origin for 'ELF with DAP' received from the off-card entity.

**O.RNG** This security objective is directly covered by FCS\_RNG.1 which ensures the cryptographic quality of random number generation.

The [PP-GP] refined this rational **O.RNG** with the requirements:

FCS\_RNG.1/GP-SCP ensures the cryptographic quality of random number generation.

**O.PIN-MNGT** This security objective is ensured by FDP\_RIP.1/ODEL, FDP\_RIP.1/OBJECTS, FDP\_RIP.1/APDU, FDP\_RIP.1/GlobalArray, FDP\_RIP.1/bArray, FDP\_RIP.1/ABORT, FDP\_RIP.1/KEYS, FDP\_RIP.1/ADEL, FDP\_RIP.1/TRANSIENT, FPR\_UNO.1, FDP\_ROL.1/FIREWALL and FDP\_SDI.2/DATA security functional requirements. The TSFs behind these are implemented by API classes. The firewall security functions (FDP\_ACC.2/FIREWALL and FDP\_ACF.1/FIREWALL) shall protect the access to private and internal data of the objects.

**O.KEY-MNGT** This relies on the same security functional requirements as O.CIPHER, plus FDP\_RIP.1 and FDP\_SDI.2/DATA as well. Precisely it is met by the following components: FCS\_CKM.1, *FCS\_CKM.2, FCS\_CKM.3,* FCS\_CMK.4, FCS\_COP.1, FPR\_UNO.1, FDP\_RIP.1/ODEL, FDP\_RIP.1/OBJECTS, FDP\_RIP.1/APDU, FDP\_RIP.1/GlobalArray, FDP\_RIP.1/bArray, FDP\_RIP.1/ABORT, FDP\_RIP.1/KEYS, FDP\_RIP.1/ADEL and FDP\_RIP.1/TRANSIENT.

The [PP-GP] refined this rational **O. KEY-MNGT** with the requirements:

- FPT\_TDC.1/GP specifies requirements preventing any possible misinterpretation of the Security Domain keys used to implement a Secure Channel when those are loaded form the off-card entity.
- FCS CKM.1/GP-SCP specifies the algorithm, key sizes, and standards used for the generation of session keys.
- FCS\_COP.1/GP-SCP specifies the cryptographic operations and algorithms that shall be used to establish a Secure Channel to protect the card management commands.

#### 8.3.1.1.4 OBJECT DELETION

**O.OBJ-DELETION** This security objective specifies that deletion of objects is secure. The security objective is met by the security functional requirements FDP\_RIP.1/ODEL and FPT\_FLS.1/ODEL.

### 8.3.1.1.5 APPLET MANAGEMENT

**O.INSTALL** The following requirements contribute to fulfil the objective:

- FDP ITC.2/GP-ELF enforces the ELF loading information flow policy when importing ELFs.
- FPT\_FLS.1/GP requires the card to preserve a secure state when failures occur during loading/installing/deleting an Executable File / application instance.
- FPT RCV.3/GP ensures safe recovery from failure.
- FCO NRO.2/GP-DAP generates an evidence of origin for 'ELF with DAP' received from the off-card entity.

ST

O.LOAD The following requirements contribute to fulfil the objective:

- FCO\_NRO.2/GP enforces the evidence of the origin during the loading of Executable Load Files, SD/Application data and keys.
- FDP\_IFC.2/GP-ELF and FDP\_IFF.1/GP-ELF enforce the ELF loading information flow control policy for managing, authenticating, and protecting the card management commands.
- FDP\_UIT.1/GP ensures the integrity of the card management operations.
- FIA\_UID.1/GP, FIA\_UAU.1/GP and FIA\_UAU.4/GP ensure appropriate identification and authentication mechanisms. In addition, these SFRs specify the actions being performed before the authentication of the origin of the received APDU commands takes place.
- FTP\_ITC.1/GP requires a trusted channel for authenticating the card management commands and for securely protecting (authenticity, integrity, and/or confidentiality) the loading of ELF/data.
- FTP\_TRP.1/GP-TF requires a trusted path between the TSF, the Target Application and the Receiving SD
- FCS\_COP.1/GP-DAP\_SHA and FCS\_COP.1/GP-DAP\_VER ensure that the loaded Executable Application is legitimate by specifying the algorithm to be used in order to verify the DAP signature of the Verification Authority.

**O.DELETION** This security objective specifies that applet and CAP file deletion must be secure. The non-introduction of security holes is ensured by the ADEL access control policy (FDP\_ACC.2/ADEL, FDP\_ACF.1/ADEL). The integrity and confidentiality of data that does not belong to the deleted applet or CAP file is a by-product of this policy as well. Non-accessibility of deleted data is met by FDP\_RIP.1/ADEL and the TSFs are protected against possible failures of the deletion procedures (FPT\_FLS.1/ADEL, FPT\_RCV.3/GP). The security functional requirements of the class FMT (FMT\_MSA.1/ADEL, FMT\_MSA.3/ADEL, and FMT\_SMR.1/ADEL) included in the group ADELG also contribute to meet this objective.

The [PP-GP] refined this rational **O.DELETION** with the requirements:

FPT RCV.3/GP ensures safe recovery from failure.

#### 8.3.1.1.6 SCP

ST

**O.SCP.RECOVERY** This security objective specifies that the platform must behave securely if an unexpected loss of power occurs. This is covered by FPT\_RCV.4/SCP which specifies the recovery after unexpected power failure.

**O.SCP.SUPPORT** This security objective specifies that the SCP provides security features to the JCS. This is provided by FPT\_TST.1/SCP. This is also provided by requirements of the IC, which are described in [AQU-IC].

**O.SCP.IC** This security objective specifies that the IC must provide mechanisms to protect itself against physical attacks. This is provided by FPT\_PHP.3/SCP. This is also provided by requirements of the IC, which are described in [AQU-IC].

#### 8.3.1.2 Card Management (GP SE Objectives)

**O.CARD-MANAGEMENT** This security objective specifies that the access control to card management functions. This is enforced by FDP\_ACC.1/CMGR, FDP\_ACF.1/CMGR, FMT\_MSA.1/CMGR, FMT\_MSA.3/CMGR, FMT\_SMF.1/GP. The [PP-GP] refined this rational **O. CARD\_MANAGEMENT** with the requirements:

- FDP UIT.1/GP ensures the integrity of card management operations.
- FDP UCT.1/GP ensures the confidentiality of card management operations.
- FDP\_ROL.1/GP ensures the rollback of the installation or removal operation on the executable files and application instances.
- FDP\_ITC.2/GP-ELF enforces the ELF loading information flow policy when importing ELFs.
- FDP\_ITC.2/GP-KL enforces the Data & Key information flow policy when importing keys and data.
- FPT\_FLS.1/GP requires the card to preserve a secure state when failures occur during loading/installing/deleting an Executable File / application instance.
- FDP\_IFC.2/GP-ELF, FDP\_IFF.1/GP-ELF, FDP\_IFC.2/GP-KL, FDP\_IFF.1/GP-KL enforce the information flow control policy for managing, authenticating, and protecting the Card management commands and responses between off-card and on-card entities.

- FIA\_UID.1/GP, FIA\_UAU.1/GP and FIA UAU.4/GP ensure appropriate identification and authentication mechanisms. In addition, these SFRs specify the actions being performed before the authentication of the origin of the received APDU commands takes place.
- FCO NRO.2/GP enforces the evidence of the origin during the loading of Executable Load Files, SD/Application data and keys.
- FPR UNO.1/GP enforces the invisibility of the imported keys and the encryption, decryption, signature generation and verification cryptographic mechanisms on SD/Application keys and data.
- FPT TDC.1/GP specifies requirements preventing any possible misinterpretation of the Security Domain keys used to implement a Secure Channel when those are loaded from the off-card entity.
- FTP ITC.1/GP requires a trusted channel for authenticating the card management commands and for securely protecting (authenticity, integrity, and/or confidentiality) the loading of ELF/data. FMT MSA.1/GP and FMT MSA.3/GP specify security attributes enabling to:
- ensure the authenticity, integrity, and/or confidentiality of card management commands:
- enforce the TOE Life cycle management and transitions.
- FMT SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the belonging commands.
- FMT SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles enabled for sending and authenticating card management commands. These commands have to be protected with regard to integrity, authenticity, and confidentiality.
- FPT RCV.3/GP ensures safe recovery from failure.
- FIA AFL.1/GP supports the objective by bounding the number of signatures that the attacker may try to attach to a message to authenticate its origin.
- FTP TRP.1/GP-TF requires a trusted path between the TSF, the Target Application and the Receiving SD
- FCS COP.1/GP-DAP SHA and FCS COP.1/GP-DAP VER ensure that the loaded Executable Application is legitimate by specifying the algorithm to be used in order to verify the DAP signature of the Verification Authority.

#### **O.DOMAIN-RIGHTS** The following requirements contribute to fulfil the objective:

- FDP IFC.2/GP-ELF, FDP IFF.1/GP-ELF, FDP IFC.2/GP-KL, FDP IFF.1/GP-KL enforce the ELF, data and keys loading information flow control policy for managing, authenticating and protecting the Card management commands and responses between off-card and on-card entities.
- FIA UID.1/GP, FIA UAU.1/GP and FIA UAU.4/GP ensure appropriate identification and authentication mechanisms. In addition, these SFRs specify the actions being performed before the authentication of the origin of the received APDU commands takes place.
- FTP ITC.1/GP requires a trusted channel for authenticating the card management commands and for securely protecting (authenticity, integrity, and/or confidentiality) the loading of ELF/data.
- FCO NRO.2/GP enforces the evidence of the origin during the loading of Executable Load Files, SD/Application data and keys.
- FMT MSA.1/GP and FMT MSA.3/GP specify security attributes enabling to:
  - ensure the authenticity, integrity, and/or confidentiality of card management commands;
  - enforce the TOE Life cycle management and transitions.
- FMT\_SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the belonging commands.
- FMT SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles enabled for sending and authenticating card management commands. These commands have to be protected with regard to integrity, authenticity, and confidentiality.
- FTP TRP.1/GP-TF requires a trusted path between the TSF, the Target Application and the Receiving SD

#### **O.APPLI-AUTH** The following requirements contribute to fulfil the objective:

- FDP IFC.2/GP-ELF, FDP IFF.1/GP-ELF enforce the ELF loading information flow control policy for managing, authenticating, and protecting the Card management commands.
- FDP ITC.2/GP-ELF enforces the ELF loading information flow policy when importing ELFs.

- FTP\_ITC.1/GP requires a trusted channel for authenticating the card management commands and for securely protecting (authenticity, integrity, and/or confidentiality) the loading of ELF/data.
- FMT\_MSA.1/GP and FMT\_MSA.3/GP specify security attributes enabling to: ensure the authenticity, integrity, and/or confidentiality of card management commands; enforce the TOE Life cycle management and transitions.
- FMT\_SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles enabled for sending and authenticating card management commands. These commands have to be protected with regard to integrity, authenticity, and confidentiality.
- FTP\_TRP.1/GP-TF requires a trusted path between the TSF, the Target Application and the Receiving SD and shall provide an assured identification of its end points and protection of the communicated data.
- FCO\_NRO.2/GP-DAP generates an evidence of origin for 'ELF with DAP' received from the off-card entity.

#### **O.SECURITY-DOMAINS** The following requirements contribute to fulfil the objective:

- FMT\_SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the belonging commands.
- FMT\_SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles enabled for sending and authenticating card management commands. These commands have to be protected with regard to integrity, authenticity, and confidentiality.
- FMT\_MSA.1/GP and FMT\_MSA.3/GP specify security attributes enabling to: Ensure the authenticity, integrity, and/or confidentiality of card management commands; enforce the TOE Life cycle management and transitions.

### **O.LC-MANAGEMENT** The following requirements contribute to fulfil the objective:

- FMT\_MTD.1/GP-LC, FMT\_MTD.3/GP cover Life Cycle Management functions and transitions.
- FMT\_SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the belonging commands.
- FMT\_SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles enabled for sending and authenticating card management commands. These commands have to be protected with regard to integrity, authenticity, and confidentiality.

FMT\_MSA.1/GP and FMT\_MSA.3/GP specify security attributes enabling to:  $\circ$  ensure the authenticity, integrity, and/or confidentiality of card management commands;  $\circ$  enforce the TOE Life cycle management and transitions.

#### 8.3.1.2.1 Privileges Management

### **O.PRIVILEGES-MANAGEMENT** The following requirements contribute to fulfil the objective:

- FMT MTD.1/GP-PR, FMT MTD.3/GP cover Privileges Assignment and Management functions.
- FMT\_SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the belonging commands.

  FMT\_SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles enabled for sending and authenticating card management commands. These commands have to be protected

### 8.3.1.2.2 Secure Communication

ST

#### **O.COMM-AUTH** The following requirements contribute to fulfil the objective:

with regard to integrity, authenticity and confidentiality.

- FTP\_ITC.1/GP requires a trusted channel for authenticating the card management commands and for securely protecting (authenticity, integrity, and/or confidentiality) the loading of ELF/data.
- FMT\_SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles

ST

# MultiApp V5.1: GP-SE Security Target

enabled for sending and authenticating card management commands. These commands have to be protected with regard to integrity, authenticity and confidentiality.

- FDP\_IFC.2/GP-ELF, FDP\_IFF.1/GP-ELF, FDP\_IFC.2/GP-KL, FDP\_IFF.1/GP-KL enforce the ELF, data and keys loading information flow control policy for managing, authenticating, and protecting the Card management commands and responses between off-card and on-card entities.
- FMT\_MSA.1/GP and FMT\_MSA.3/GP specify security attributes enabling to: ensure the authenticity, integrity, and/or confidentiality of card management commands; enforce the TOE Life cycle management and transitions.
- FIA\_UID.1/GP, FIA\_UAU.1/GP and FIA\_UAU.4/GP ensure appropriate identification and authentication mechanisms. In addition, these SFRs specify the actions being performed before the authentication of the origin of the received APDU commands takes place.
- FCS\_COP.1/GP-SCP specifies the cryptographic operations and algorithms that shall be applied for the authorisation of the card management commands.
- FMT\_SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the belonging commands.
- FTP\_TRP.1/GP-TF enforce the identification of its end points thanks to a communication trusted path

### **O.COMM-INTEGRITY** The following requirements contribute to fulfil the objective:

- FTP\_ITC.1/GP requires a trusted channel for authenticating the card management commands and for securely protecting (authenticity, integrity, and/or confidentiality) the loading of ELF/data.
- FMT\_SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the belonging commands.
- FMT\_SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles enabled for sending and authenticating card management commands. These commands have to be protected with regard to integrity, authenticity, and confidentiality.
- FDP\_IFC.2/GP-ELF, FDP\_IFF.1/GP-ELF, FDP\_IFC.2/GP-KL, FDP\_IFF.1/GP-KL enforce the ELF, data and keys loading information flow control policy for managing, authenticating, and protecting the Card management commands and responses between off-card and on-card entities.
- FMT MSA.1/GP and FMT MSA.3/GP specify security attributes enabling to:
  - o ensure the authenticity, integrity, and/or confidentiality of card management commands;
  - o enforce the TOE Life cycle management and transitions.
- FCS\_COP.1/GP-SCP specifies the cryptographic operations and algorithms that shall be used to ensure the integrity of the card management commands.
- FTP\_TRP.1/GP-TF requires a trusted path between the TSF, the Target Application and the Receiving SD and shall provide an assured identification of its end points and protection of the communicated data

#### **O.COMM-CONFIDENTIALITY** The following requirements contribute to fulfil the objective:

- FTP\_ITC.1/GP requires a trusted channel for authenticating the card management commands and for securely protecting (authenticity, integrity, and/or confidentiality) the loading of ELF/data.
- FMT\_SMF.1/GP enforces the card management operations (Loading, Installation, etc.), the privileges, the life cycle states and transition by defining the protective actions for the belonging commands.
- FMT\_SMR.1/GP maintains the roles S.OPEN, ISD, SSD, Application, and their associated Life Cycle states. In addition, it maintains the Application Provider, Controlling Authority roles and specifies the authorised roles enabled for sending and authenticating card management commands. These commands have to be protected with regard to integrity, authenticity, and confidentiality.
- FDP\_IFC.2/GP-ELF, FDP\_IFF.1/GP-ELF, FDP\_IFC.2/GP-KL, FDP\_IFF.1/GP-KL enforce the ELF, data and keys loading information flow control policy for managing, authenticating, and protecting the Card management commands and responses between off-card and on-card entities.
- FMT\_MSA.1/GP and FMT\_MSA.3/GP specify security attributes enabling to: ensure the authenticity, integrity, and/or confidentiality of card management commands; enforce the TOE Life cycle management and transitions.

- FCS\_COP.1/GP-SCP specifies the cryptographic operations and algorithms that shall be used to ensure the confidentiality of the card management commands (decryption of the card management commands).
- FTP\_TRP.1/GP-TF requires a trusted path between the TSF, the Target Application and the Receiving SD and shall provide an assured identification of its end points and protection of the communicated data

#### **O.NO-KEY-REUSE** The following requirements contribute to fulfil the objective:

- FIA\_UAU.4/GP enforces the objective by requesting the TSF to prevent the reuse of authentication data related to the implementation of Secure Channels.
- FIA\_AFL.1/GP supports the objective by bounding the number of signatures that the attacker may try to attach to a message to authenticate its origin.

#### 8.3.1.2.3 ASFR

**O.SpecificAPI** The security objective is met by the following SFR FPT\_FLS.1/SpecificAPI, FPT\_ITT.1/SpecificAPI and FPR\_UNO.1/SpecificAPI.

O.RNG The security objective O.RNG is met by the following SFR FCS RNG.1/PACE.

#### 8.3.1.2.4 Package 'Cardholder Verification Method (CVM - GP SE Objectives)

**O.CVM-BLOCK** is fulfilled by FIA\_AFL.1.1/GP-CVM which detects the authentication failure attempts related to user authentication using CVM.

**O.GLOBAL-CVM** is fulfilled by FPR\_UNO.1/GP-CVM which ensures that unauthorized users are unable to observe the comparison on Global PIN.

#### **O.CVM-MGMT** is fulfilled by the following SFRs:

- FPR UNO.1/GP-CVM ensures that unauthorized users are unable to observe the comparison on Global PIN.
- FIA AFL.1.1/GP-CVM detects the authentication failure attempts related to user authentication using CVM.

### 8.3.1.2.5 Package 'Delegated Management (DM - GP SE Objectives)

#### **O.RECEIPT** is fulfilled by the following SFRs:

- FCO NRR.1/GP-RECEIPT generates evidence of receipt for received card management operation requests.
- FCS\_COP.1/GP-RECEIPT ensures that the card management command has been successfully processed by computing the Receipt signature.

#### O.TOKEN is fulfilled by the following SFRs:

- FCO\_NRO.2/GP-TOKEN generates an evidence of origin for `ELF with Token Verification' received from the offcard entity.
- FCS\_COP.1/GP-TOKEN ensures that the card management command is authorized by verifying the Token signature.

#### 8.3.1.2.6 Package 'DAP Verification (GP SE Objectives)

No specific Objectives

ST

### 8.3.1.2.7 Package "PP-Module OS Update"

#### **O.SECURE\_LOAD\_ACODE** is fulfilled by the following SFRs:

- FDP\_ACC.1/OS-UPDATE and FDP\_ACF.1/OS-UPDATE enforce the OS Update Access Control Policy on the loading, installation, and activation of additional code.
- FMT\_MSA.3/OS-UPDATE specifies security attributes that support management of the loading, installation, and activation of additional code.
- FMT\_SMR.1/OS-UPDATE maintains the role of OS Developer, which is responsible for signature verification and decryption of additional code before Loading, Installation, and Activation.
- FMT SMF.1/OS-UPDATE manages the activation of additional code.
- FCS\_COP.1/OS-UPDATE-VER specifies the cryptographic algorithms used to perform digital signature verification of the additional code to be loaded.

#### O.SECURE\_AC\_ACTIVATION is fulfilled by the following SFRs:

- FDP\_ACC.1/OS-UPDATE and FDP\_ACF.1/OS-UPDATE enforce the OS Update Access Control Policy on the loading, installation, and activation of additional code.
- FMT\_MSA.3/OS-UPDATE specifies security attributes that support management of the loading, installation, and activation of additional code.
- FMT\_SMR.1/OS-UPDATE maintains the role of OS Developer, which is responsible for signature verification and decryption of additional code before Loading, Installation, and Activation.
- FMT\_SMF.1/OS-UPDATE manages the activation of additional code.
- FPT\_FLS.1/OS-UPDATE ensures that the TOE remains in a secure state in case of interruption or incident which prevents the forming of the Updated TOE.

#### **O.TOE\_IDENTIFICATION** is fulfilled by the following SFRs:

- FDP\_ACC.1/OS-UPDATE and FDP\_ACF.1/OS-UPDATE enforce the OS Update Access Control Policy on the loading, installation, and activation of additional code.
- FIA\_ATD.1/OS-UPDATE maintains the additional code ID for each activated additional code.
- FMT\_MSA.3/OS-UPDATE specifies security attributes that support management of the loading, installation, and activation of additional code.
- FMT\_SMR.1/OS-UPDATE maintains the role of OS Developer, which is responsible for signature verification and decryption of additional code before Loading, Installation, and Activation.
- FMT SMF.1/OS-UPDATE manages the activation of additional code.

### **O.CONFID-OS-UPDATE.LOAD** is fulfilled by the following SFRs:

- FDP\_ACC.1/OS-UPDATE and FDP\_ACF.1/OS-UPDATE enforce the OS Update Access Control Policy on the loading, installation, and activation of additional code.
- FMT\_MSA.3/OS-UPDATE specifies security attributes that support management of the loading, installation, and activation of additional code.
- FMT\_SMR.1/OS-UPDATE maintains the role of OS Developer, which is responsible for signature verification and decryption of additional code before Loading, Installation, and Activation.
- FMT SMF.1/OS-UPDATE manages the activation of additional code.
- FTP\_TRP.1/OS-UPDATE provides a trusted path during the transmission of the additional code to the TOE for loading.
- FCS\_COP.1/OS-UPDATE-DEC specifies the cryptographic algorithms used to decrypt the additional code prior to installation.

ST

# MultiApp V5.1: GP-SE Security Target

## 8.3.2 Security Functional Requirements Rationale for PACE Module

The rationale in this paragraph comes from [PP- EAC2] §6.3.1

|                                | ,          |                   |                      |                         |                   |                    |                  |                     |                     |

**Table 46: Security Functional Requirement Rationale** 

Note: SFR followed by (o) (respectively (p)) means SFR is applicable in Operational phase (respectively (p)) personalization phase.

The security objective **OT.Identification** "Identification of the TOE" addresses the storage of Initialisation and PrePersonalisation Data in its non-volatile memory, whereby they also include the IC Identification Data uniquely identifying the TOE's chip. The SFR FMT\_MTD.1/INI\_ENA and FCS\_COP.1/PACE\_CAM allow only the Manufacturer to write Initialisation and Pre-personalisation Data (including the Personalisation Agent key). The SFR FMT\_MTD.1/INI\_DIS requires the Personalisation Agent to disable access to Initialisation and Pre-personalisation Data in the life cycle phase

'operational use'. The SFRs FMT\_SMF.1/PACE, FMT\_SMF.1/PERSO and FMT\_SMR.1/PACE support the functions and roles related. the card issuing life cycle phases of the application data requiring PACE usage

The security objective **OT.AC\_Pers** "Access Control for Personalization" The TOE must ensure that the TOE and Applicative data (e.g. PACE data and MRTD data (if any) e.g. logical travel document data in EF.DG1 to EF.DG16, the Document Security Object according to LDS [PKI]) and the TSF data can be written by authorized Personalisation Agents only with PACE authentication using FCS\_CKM.1/DH\_PACE,.The SFR FCS\_RNG.1/PACE represents a general support for cryptographic operations needed. In pre-personalisation, the SFR FCS\_CKM.1/PERSO and FCS\_COP.1/PERSO ensure the integrity of data transfers after successful authentication of the pre-personalisation agent according to FIA\_UID.1/PERSO and FIA\_UAU.1/PERSO with the support of FIA\_AFL.1/PERSO. The FDP\_RIP.1/PACE require erasing the values of session keys. the TSF data are protected in confidentiality and integrity against physical manipulation by FPT\_PHP.3. The FDP\_RIP.1/PACE requires erasing the values of session keys.

The Personalisation Agent must identify and authenticate themselves according to FIA\_UID.1/PACE and FIA\_UAU.1/PACE before accessing these data. FIA\_UAU.4/PACE, FIA\_UAU.5/PACE, FIA\_UAU.6/PACE and FCS CKM.4/PACE represent some required specific properties of the protocols used.

Unauthorised modifying of the exchanged data is addressed, in the first line, by FTP\_ITC.1/PACE using FCS\_COP.1/PACE\_MAC.

The TOE and Applicative data (e.g. logical travel document data in EF.DG1 to EF.DG16) and the TSF data may be written only during and cannot be changed after personalisation phase. The SFR FMT\_SMR.1/PERSO manages the roles (including Personalization Agent) and the SFR FMT\_SMF.1/PERSO lists the TSF management functions (including Personalization).

The security objective **OT.Data\_Integrity** "Application data" requires the TOE to protect the integrity of the application data requiring usage of PACE (e.g. logical travel document) stored on the TOE against physical manipulation and unauthorized writing. Physical manipulation is addressed by FPT\_PHP.3. The Personalisation Agent must identify and authenticate themselves according to FIA\_UID.1/PACE and FIA\_UAU.1/PACE before accessing these data. FIA\_UAU.4/PACE, FIA\_UAU.5/PACE and FCS\_CKM.4/PACE represent some required specific properties of the protocols used. The SFR FMT\_SMR.1/PACE & FMT\_SMR.1/PERSO manage the roles and the SFR FMT\_SMF.1/PACE & FMT\_SMF.1/PERSO manage the TSF management functions.

Unauthorised modifying of the exchanged data is addressed, in the first line, by FTP\_ITC.1/PACE using FCS\_COP.1/PACE\_MAC. For PACE secured data exchange, a prerequisite for establishing this trusted channel is a successful PACE Authentication (FIA\_UID.1/PACE, FIA\_UAU.1/PACE) using FCS\_CKM.1/DH\_PACE and possessing the special properties FIA\_UAU.5/PACE, FIA\_UAU.6/PACE.

FIA\_AFL.1/PACE allows to manage errors in PACE secure channel management.

FDP\_RIP.1/PACE requires erasing the values of session keys (here: for K<sub>MAC</sub>).

The session keys are destroyed according to FCS\_CKM.4/PACE after use.

In pre-personalisation, the SFR FCS\_CKM.1/PERSO and FCS\_COP.1/PERSO ensure the integrity of data transfers after successful authentication of the pre-personalisation agent according to FIA\_UID.1/PERSO and FIA\_UAU.1/PERSO, with the support of FIA\_AFL.1/PERSO.

The security objective **OT.Data\_Authenticity** aims ensuring authenticity of the User and TSF data (after the PACE authentication) by enabling its verification at the terminal-side and by an active verification by the TOE itself. This objective is mainly achieved by FTP\_ITC.1/PACE using FCS\_COP.1/PACE\_MAC. A prerequisite for establishing this trusted channel is a successful PACE or Chip and Terminal Authentication v.1 (FIA\_UID.1/PACE, FIA\_UAU.1/PACE) using FCS\_CKM.1/DH\_PACE and possessing the special properties FIA\_UAU.5/PACE, FIA\_UAU.6/PACE. FDP\_RIP.1/PACE requires erasing the values of session keys (here: for KMAC). FIA\_UAU.4/PACE, FIA\_UAU.5/PACE and FCS\_CKM.4/PACE represent some required specific properties of the protocols used. FIA\_AFL.1/PACE allows to manage errors in PACE secure channel management.

The SFR FMT\_MTD.1./KEY\_READ restricts the access to the PACE passwords. The SFR FCS\_RNG.1/PACE represents a general support for cryptographic operations needed. The SFR FMT\_SMR.1/PACE & FMT\_SMR.1/PERSO manage the roles and the SFR FMT\_SMF.1/PACE & FMT\_SMF.1/PERSO manage the TSF management functions.

ST

In pre-personalisation, the SFR FCS\_CKM.1/PERSO and FCS\_COP.1/PERSO ensure the authenticity of data transfers after successful authentication of the pre-personalisation agent according to FIA\_UID.1/PERSO and FIA\_UAU.1/PERSO, with the support of FIA\_AFL.1/PERSO.

The security objective **OT.Data\_Confidentiality** aims that the TOE always ensures confidentiality of the User and TSF data stored and, after the PACE Physical manipulation is addressed by FPT\_PHP.3. FIA\_UAU.4/PACE, FIA\_UAU.5/PACE and FCS\_CKM.4/PACE represent some required specific properties of the protocols used. This objective for the data exchanged is mainly achieved by FTP\_ITC.1/PACE using FCS\_COP.1/PACE\_ENC. A prerequisite for establishing this trusted channel is a successful PACE (FIA\_UID.1/PACE, FIA\_UAU.1/PACE) using FCS\_CKM.1/DH\_PACE and possessing the special properties FIA\_UAU.5/PACE, FIA\_UAU.6/PACE. FDP\_RIP.1/PACE requires erasing the values of session keys (here: for K<sub>ENC</sub>). FIA\_AFL.1/PACE allows to manage errors in PACE secure channel management.

The SFR FMT\_MTD.1./KEY\_READ restricts the access to the PACE passwords. The SFR FCS\_RNG.1/PACE represents the general support for cryptographic operations needed. The SFR FMT\_SMR.1/PACE, & FMT\_SMR.1/PERSO manage the roles and the SFR FMT\_SMF.1/PACE & FMT\_SMF.1/PERSO manage the TSF management functions. In pre-personalisation, the SFR FCS\_CKM.1/PERSO and FCS\_COP.1/PERSO ensure the confidentiality of data transfers after successful authentication of the pre-personalisation agent according to FIA\_UID.1/PERSO and FIA\_UAU.1/PERSO, with the support of FIA\_AFL.1/PERSO.

The SFR FMT\_MTD.1/KEY\_READ requires that data cannot be unauthorized read afterwards.

The security objective **OT.Prot\_Abuse\_Func** "Protection against Abuse of Functionality" is ensured by the SFR FMT\_LIM.1/PERSO and FMT\_LIM.2/PERSO which prevent misuse of test functionality of the TOE or other features which may not be used after TOE Delivery.

The security objective **OT.Prot\_Inf\_Leak** "Protection against Information Leakage" requires the TOE to protect confidential TSF data stored and/or processed in the travel document's chip against disclosure

- by measurement and analysis of the shape and amplitude of signals or the time between events found by measuring signals on the electromagnetic field, power consumption, clock, or I/O lines which is addressed by the SFR FPT\_EMS.1,
- by forcing a malfunction of the TOE which is addressed by the SFR FPT\_FLS.1 and FPT\_TST.1, and/or by a physical manipulation of the TOE which is addressed by the SFR FPT\_PHP.3.

The security objective **OT.Prot\_Phys\_Tamper** "Protection against Physical Tampering" is covered by the SFR FPT PHP.3.

The security objective **OT.Prot\_Malfunction** "Protection against Malfunctions" is covered by (i) the SFR FPT\_TST.1 which requires self-tests to demonstrate the correct operation and tests of authorized users to verify the integrity of TSF data and TSF code, and (ii) the SFR FPT\_FLS.1 which requires a secure state in case of detected failure or operating conditions possibly causing a malfunction.

#### Additionally to OT.Data Integrity, OT.Data Authenticity and OT.Data Confidentiality

Since PACE can use the PIN as the shared secret, using and management of PIN, the SFRs FIA\_AFL.1/PACE, FMT\_MTD.1/Initialize\_PINPUK, FMT\_MTD.1/Resume\_PINPUK, FMT\_MTD.1/Change\_PIN, FMT\_MTD.1/Unblock\_PIN support the achievement of these objectives.

Table 47: SFR dependencies for PP JCS-OPEN

#### 8.3.3.1.1 RATIONALE FOR THE EXCLUSION OF DEPENDENCIES

The dependency FIA\_UID.1 of FMT\_SMR.1/Installer is unsupported. This is required by the component FMT\_SMR.1 in group InstG. However, the role installer defined in this component is attached to an IT security function rather than to a "user" of the CC terminology. The installer does not "identify" itself with respect to the TOE, but is a part of it. Thus, here it is claimed that this dependency can be left out. The reader may notice that the role is required because of the SFRs on management of TSF data and security attributes, essentially those of the firewall policy.

The dependency FAU\_SAA.1 of FAU\_ARP.1 is unsupported. Potential violation analysis is used to specify the set of auditable events whose occurrence or accumulated occurrence held to indicate a potential violation of the SFRs, and any rules to be used to perform the violation analysis. The dependency of FAU\_ARP.1 on this functional requirement assumes that a "potential security violation" is an audit event indicated by the FAU\_SAA.1 component. The events listed in FAU\_ARP.1 are, on the contrary, merely self-contained ones (arithmetic exception, ill-formed bytecodes, access failure) and ask for a straightforward reaction of the TSFs on their occurrence at runtime. The JCVM or other components of the TOE detect these events during their usual working order. Thus, in principle there would be no applicable audit recording in this framework. Moreover, no specification of one such recording is provided elsewhere. Therefore no set of auditable events could possibly be defined.

The dependency FIA\_UID.1 of FMT\_SMR.1/ADEL is unsupported. This is required by the component FMT\_SMR.1 in group ADELG. However, the role applet deletion manager defined in this component is attached to an IT security function rather than to a "user" of the CC terminology. The installer does not "identify" itself with respect to the TOE, but is a part of it. Thus, here it is claimed that this dependency can be left out. The reader may notice that the role is required because of the SFRs on management of TSF data and security attributes, essentially those of the firewall policy.

#### 8.3.3.2 SFRS DEPENDENCIES for PP GP-SE

Table 53: Security Functional Requirement Dependencies for PACE Module

### 8.3.5 Compatibility between SFR of TOE and SFR of [AQU-IC]

The following table lists the SFRs that are declared on the [AQU-IC] Integrated Circuit Security Target [AQU-IC] and separates them in:

IP\_SFR: Irrelevant Platform-SFRs not being used by the Composite-ST.

**RP\_SFR-SERV**: Relevant Platform-SFRs being used by the Composite-ST to implement a security service with associated TSFI.

**MRP\_SFR-MECH**: Relevant Platform-SFRs being used by the Composite-ST because of its security properties providing protection against attacks to the TOE as a whole and are addressed in ADV\_ARC. These required security properties are a result of the security mechanisms and services that are implemented in the Platform TOE, as specified in [JIL\_CPE].

These definitions are according to the [JIL\_CPE] on which the Platform TOE on our case is the relaying IC, the [AQU-IC] Integrated Circuit.

The first column lists the [AQU-IC] and the next columns indicate their classification according to the paragraph above. The SFR's on the cells of the classification belong the MultiApp v5.1 TOE described in this document. If there is no SFR on each cell is because not all CC class families have a corresponding match on both sides, but all SFRs from the [AQU-IC] have been classified. Moreover, no contradictions have been found between the Platform-SFRs set and the SFRs related to the composite product.

Table 56: SAR dependencies for EAL6

### 8.3.8 RATIONALE FOR THE SECURITY ASSURANCE REQUIREMENTS

### 8.3.8.1 EAL6: semiformally verified design and tested

EAL6 is required for this type of TOE and product since it is intended to defend against sophisticated attacks. This evaluation assurance level allows a developer to gain high assurance from application of security engineering techniques to a rigorous development environment in order to produce a premium TOE for protecting high value assets against significant risks.

The evaluators should have access to the a formal model of select TOE security policies and a semiformal presentation of the functional specification and TOE low level design and source code.

### 8.3.8.2 ALC\_FLR.2 Flaw reporting procedures

ST

This augmentation claim in this Security Target will cover the policies and procedures applied to track and correct flaws and support surveillance of this TOE.

## 9 TOE SUMMARY SPECIFICATION

### 9.1 TOE SECURITY FONCTION

TOE Security Functions are provided by the TOE embedded software (including the optional NVM ES) and by the chip.

### 9.1.1 SF provided by MultiApp V5.1 platform

### 9.1.1.1 SF.FW: Firewall

The JCRE firewall enforces applet isolation. The *JCRE* shall allocate and manage a context for each *applet* or *package* installed respectively loaded on the card and its own JCRE context. *Applet* cannot access each other's objects unless they are defined in the same package (they share the same context) or they use the object sharing mechanism supported by *JCRE*.

| An operation OP.PUT (S1, S.MEMBER, I) is allowed if and only if the active context is "JCRE"; other OP.PUT operations are allowed regardless of the active context's value.  | FDP_IFC.1/JCVM<br>FDP_IFF.1/JCVM         |
|--|--|
| Upon allocation of a resource to class instances and arrays, any previous information content of the resource is made unavailable  | FDP_RIP.1/OBJECTS                        |
| Only the S.JCRE can modify the security attributes the active context, the selected applet context security attributes.  | FMT_MSA.1/JCRE                           |
| Only the S.JCVM can modify the security attributes the active context, the currently active Context and the Active Applets security attributes.  | FMT_MSA.1/JCVM                           |
| provide restrictive default values for security attributes that are used to enforce the SFP.   | FMT_MSA.3/JCVM                           |
| only secure values are accepted for all the security attributes of subjects and objects defined in the FIREWALL access control SFP and the JCVM information flow control SFP.  | FMT_MSA.2/FIREWALL_<br>JCVM              |
| provide restrictive default values for security attributes that are used to enforce the SFP.   | FMT_MSA.3/FIREWALL                       |
| The TSF maintains the roles: the Java Card RE, the Java Card VM. The TSF is able to associate users with roles.  | FMT_SMR.1/JCRE                           |
| The TSF is capable of performing the following management functions:   | FMT_SMF.1/CORE_LC                        |
| <ul> <li>Modify the active context and the SELECTed applet Context.</li> <li>Modify the list of registered applets' AID</li> </ul>   |  |
| ([JCRE3]§6.2.8) An S.CAP_FILE may freely perform any of OP.ARRAY_ACCESS, OP.INSTANCE_FIELD, OP.INVK_VIRTUAL, OP.INVK_INTERFACE, OP.THROW or OP.TYPE_ACCESS upon any O.JAVAOBJECT whose Sharing attribute has value "JCRE entry point" or "global array".   | FDP_ACC.2/FIREWALL<br>FDP_ACF.1/FIREWALL |
| ([JCRE3]§6.2.8) An S.CAP_FILE may freely perform any of OP.ARRAY_ACCESS, OP.INSTANCE_FIELD, OP.INVK_VIRTUAL, OP.INVK_INTERFACE or OP.THROW upon any O.JAVAOBJECT whose Sharing attribute has value "Standard" and whose Lifetime attribute has value "PERSISTENT" only if O.JAVAOBJECT's Context attribute has the same value as the active context. | FDP_ACC.2/FIREWALL<br>FDP_ACF.1/FIREWALL |
| ([JCRE3]§6.2.8.10) An S.CAP_FILE may perform OP.TYPE_ACCESS upon an O.JAVAOBJECT whose Sharing attribute has value "SIO" only if O.JAVAOBJECT is being cast into (checkcast) or is being verified as being an instance of (instanceof) an interface that extends the Shareable interface.  | FDP_ACC.2/FIREWALL<br>FDP_ACF.1/FIREWALL |

| ([JCRE3], §6.2.8.6,) An S.CAP_FILE may perform OP.INVK_INTERFACE upon an O.JAVAOBJECT whose Sharing attribute has the value "SIO", and whose Context attribute has the value "Package AID", only if one of the following applies:  (c) The value of the attribute Selection Status of the package whose AID is "Package AID" is "Multiselectable",  (d) The value of the attribute Selection Status of the package whose AID is "Package AID' is "Non-multiselectable", and either "Package AID" is the value of the currently selected applet or otherwise "Package AID" does not occur in the attribute ActiveApplets, and in either of the cases above the invoked interface method extends the Shareable interface | FDP_ACC.2/FIREWALL<br>FDP_ACF.1/FIREWALL |
|--|--|
| An S.CAP_FILE may perform an OP.CREATE only if the value of the Sharing parameter(*) is "Standard".  | FDP_ACC.2/FIREWALL<br>FDP_ACF.1/FIREWALL |
| <ul> <li>The subject S.JCRE can freely perform OP.JAVA() and OP.CREATE, with the following two exceptions:</li> <li>1. Any subject with OP.JAVA upon an O.JAVAOBJECT whose LifeTime attribute has value "CLEAR_ON_DESELECT" if O.JAVAOBJECT's Context attribute is not the same as the SELECTed applet Context.</li> <li>2. Any subject with OP.CREATE and a "CLEAR_ON_DESELECT" LifeTime parameter if the active context is not the same as the SELECTed applet Context.</li> </ul>   | FDP_ACC.2/FIREWALL<br>FDP_ACF.1/FIREWALL |
| The TSF allows the rollback of the operations OP.JAVA and OP.CREATE on the O.JAVAOBJECTs.  | FDP_ROL.1/FIREWALL                       |
| The TSF allows operations to be rolled back within the scope of a select(), deselect(), process() or install() call, notwithstanding the restrictions given in [JCRE3], §7.7, within the bounds of the Commit Capacity ([JCRE3], §7.8), and those described in [JCAPI3].   | FDP_ROL.1/FIREWALL                       |
| Only updates to persistent objects participate in the transaction. Updates to transient objects and global arrays are never undone, regardless of whether or not they were "inside a transaction." [JCRE3], §7.7   | FDP_ROL.1/FIREWALL                       |
| A TransactionException is thrown if the commit capacity is exceeded during a transaction. [JCRE3], §7.8  | FDP_ROL.1/FIREWALL                       |
| Transaction & PIN: When comparing a PIN, even if a transaction is in progress, update of internal state - the try counter, the validated flag, and the blocking state, do not participate in the transaction. [JCAPI3]   | FDP_ROL.1/FIREWALL                       |

ST

### 9.1.1.2 SF.API: Application Programming Interface

This security function provides the cryptographic algorithm and functions used by the TSF:

- TDES algorithm support 112-bit key and 168-bit key
- RSA algorithm supports up to 4096 bit keys (Std method or CRT method).
- AES algorithm with 128, 192 and 256 bit keys.
- Random generator uses the certified Hardware Random Generator that fulfils the requirements of AIS31 (see [ST IC]).
- SHA-1, SHA224, SHA-256, SHA-384, and SHA-512 algorithms
- Diffie-Hellman based on exponentiation and on EC algorithm.
- PACE based on DH algorithm (integrated mapping and generic mapping)
- PACE based on ECDH algorithm (integrated mapping and generic mapping)

This security function controls all the operations relative to the card keys management.

- Key generation: The TOE provides the following:
  - o RSA key generation manages 1024 to 2048-bits long keys. The RSA key generation is SW and does not use the IC cryptographic library.
  - o The TDES key generation (for session keys) uses the random generator.
  - o AES key generation
  - o DH key generation
  - o ECDH key generation
- <u>Key destruction</u>: the TOE provides a specified cryptographic key destruction method that makes Key unavailable.

This security function ensures the confidentiality of keys during manipulation and ensures the de-allocation of memory after use.

This security function is supported by the IC security function SF.CS (Cryptographic support) for Random Number Generator (see [ST\_IC]).

## 9.1.1.3 SF.CSM: Card Security Management

| Upon allocation of a resource to the APDU buffer, any previous information content of the resource is made unavailable.  | FDP_RIP.1/APDU      |
|--|---------------------|
| Upon deallocation of a resource from the bArray object, any previous information content of the resource is made unavailable.  | FDP_RIP.1/bArray    |
| Upon deallocation of a resource from any reference to an object instance created during an aborted transaction, any previous information content of the resource is made unavailable.  | FDP_RIP.1/ABORT     |
| Upon deallocation of a resource from the cryptographic buffer (D.CRYPTO), any previous information content of the resource is made unavailable.  | FDP_RIP.1/KEYS      |
| Upon deallocation of a resource from the applet as a result of returning from the process method to the following objects: a user Global Array, any previous information content of the resource is made unavailable.  |                     |
| Upon deallocation of a resource from the transient object, any previous information content of the resource is made unavailable.   | FDP_RIP.1/TRANSIENT |
| <ul> <li>The TSF takes the following actions:</li> <li>throw an exception,</li> <li>or lock the card session</li> <li>or reinitialize the Java Card System and its data upon detection of a potential security violation.</li> </ul>   | FAU_ARP.1           |
| The TOE detects the following potential security violation: CAP file inconsistency   | FAU_ARP.1           |
| <ul> <li>Applet life cycle inconsistency</li> <li>Card Manager life cycle inconsistency</li> <li>Card tearing (unexpected removal of the Card out of the CAD) and power failure</li> <li>Abortion of a transaction in an unexpected context (see abortTransaction(), [JCAPI3] and ([JCRE3], §7.6.2)</li> <li>Violation of the Firewall or JCVM SFPs</li> <li>Unavailability of resources</li> <li>Array overflow</li> <li>Random trap detection</li> </ul> |                     |
| The TSF is able to monitor user data stored in containers controlled by the TSF for <b>integrity errors</b> on all the following objects: Cryptographic keys, PINs, applets, and softmasks when they are stored in EEPROM. Upon detection of a data integrity error, the TSF:  | FDP_SDI.2/DATA      |
| <ul><li>Prevents the use of modified data</li><li>Raises an exception</li></ul>  |                     |

| In order to consistently interpret the CAP files, the bytecode and its data argument, when shared between the TSF and another trusted IT product, the TSF is using:  The rules defined in [JCVM3] specification;  The API tokens defined in the export files of reference implementation  The rules defined in ISO 7816-6  The rules defined in [GP23] specification  | FPT_TDC.1<br>FPT_TDC.1/GP |
|---|---------------------------|
| The TSF preserves a secure state when the following types of failures occur: those associated to the potential security violations described in FAU_ARP.1.  The Java Card RE Context is the Current context when the Java Card VM begins running after a card reset ([JCRE3], §6.2.3) or after a proximity card (PICC) activation sequence ([JCRE3] §4.1.2). Behavior of the TOE on power loss and reset is described in [JCRE3], §3.6, and §7.1. Behavior of the TOE on RF signal loss is described in [JCRE3], §3.6.2 | FPT_FLS.1/JCS             |
| No one can observe the operation cryptographic operations / comparisons operations on Key values / PIN values by S.JCRE, S.Applet.  | FPR_UNO.1                 |
| SDs and Applications cannot observe the operation: keys or data import, encryption, decryption, signature generation and verification on keys and data by the OPEN or any other SD or Application.  | FPR_UNO.1/GP              |

### 9.1.1.4 SF.AID: AID Management

| Only the JCRE can modify the list of registered applets' AIDs.   | FMT_MTD.1/JCRE |
|--|----------------|
| Only secure values are accepted for the AIDs of registered applets.  | FMT_MTD.3/JCRE |
| The TSF maintains the following list of security attributes belonging to individual users:  • package AID  • Applet's version number  • registered applet's AID  • applet selection status ([JCVM3], §6.5) | FIA_ATD.1/AID  |
| The TSF requires each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.  | FIA_UID.2/AID  |
| Initial applet selection is performed as described in [JCRE3]§4 Applet selection is performed after a successful SELECT FILE command as described in [JCRE3]§4.  | FIA_USB.1/AID  |

## 9.1.1.5 SF.INST: Installer

| the protocol used provides for the unambiguous association between the security attributes and the user data received:  The format of the CAP file is precisely defined in Sun's specification ([JCVM3]); it contains the user data (like applet's code and data) and the security attribute altogether.   | FDP_ITC.2/GP-ELF |
|--|------------------|
| Each package contains a package Version attribute, which is a pair of major and minor version numbers ([JCVM3], §4.5). With the AID, it describes the package defined in the CAP file. When an export file is used during preparation of a CAP file, the versions numbers and AIDs indicated in the export file are recorded in the CAP files ([JCVM3], §4.5.2): the dependent packages Versions and AIDs attributes allow the retrieval of these identifications Implementation-dependent checks may occur on a case-by-case basis to indicate that package files are binary compatibles. However, package files do have "package Version Numbers" ([JCVM3]) used to indicate binary compatibility or | FDP_ITC.2/GP-ELF |

| incompatibility between successive implementations of a package, which obviously directly concern this requirement.  |                  |
|--|------------------|
| A package may depend on (import or use data from) other packages already installed. This dependency is explicitly stated in the loaded package in the form of a list of package AIDs. The loading is allowed only if, for each dependent package, its AID attribute is equal to a resident package AID attribute, the major (minor) Version attribute associated to the former is equal (less than or equal) to the major (minor) Version attribute associated to the latter ([JCVM3],§4.5.2). | FDP_ITC.2/GP-ELF |
| The TSF maintains the roles: the installer   | FMT_SMR.1/GP     |
| The TSF preserves a secure state when the following types of failures occur: the installer fails to load/install a package/applet as described in [JCRE3] §11.1.4  | FPT_FLS.1/GP     |
| After Failure during applet loading, installation and deletion; sensitive data loading, the TSF ensures the return of the TOE to a secure state using automated procedures. The TSF provides the capability to determine the objects that were or were not capable of being recovered.   | FPT_RCV.3/GP     |

## 9.1.1.6 SF.ADEL: Applet Deletion

| Only the Java Card RE (S.JCRE) can modify the security attributes:  | FMT MSA.1/ADEL |
|---|----------------|
| ActiveApplets.  |                |
| The modification of the ActiveApplets security attribute should be performed in   |                |
| accordance with the rules given in [JCRE3], §4.   |                |
| Provide restrictive default values for security attributes that are used to enforce the SFP.                                    | FMT_MSA.3/ADEL |
| The TSF maintains the roles: the applet deletion manager.   | FMT_SMR.1/ADEL |
| The TSF is able to Modify the ActiveApplets security attribute.   | FMT_SMF.1/ADEL |
| ([JCRE3], §11.3.4.1, Applet Instance Deletion). The S.ADEL may perform  | FDP_ACC.2/ADEL |
| OP.DELETE_APPLET upon an O.APPLET only if,  | FDP_ACF.1/ADEL |
| (1) S.ADEL is currently selected,   |                |
| (2) O.APPLET is deselected and  |                |
| (3) there is no O.JAVAOBJECT owned by O.APPLET such that either O.JAVAOBJECT is reachable from an applet instance distinct from |                |
| O.APPLET, or O.JAVAOBJECT is reachable from a package P, or   |                |
| ([JCRE3], §8.5) O.JAVAOBJECT is remote reachable.   |                |
| ([JCRE3], §11.3.4.1, Multiple Applet Instance Deletion). The S.ADEL may perform   | FDP_ACC.2/ADEL |
| OP.DELETE_APPLET upon several O.APPLET only if,   | FDP_ACF.1/ADEL |
| (1) S.ADEL is currently selected,   |                |
| (2) every O.APPLET being deleted is deselected and  |                |
| (3) there is no O.JAVAOBJECT owned by any of the O.APPLET being   |                |
| deleted such that either O.JAVAOBJECT is reachable from an applet   |                |
| instance distinct from any of those O.APPLET, or O.JAVAOBJECT is  |                |
| reachable from a package P, or ([JCRE3], §8.5) O.JAVAOBJECT is remote reachable.  |                |
| ([JCRE3], §11.3.4.2, Applet/Library Package Deletion). The S.ADEL may perform   | FDP ACC.2/ADEL |
| OP.DELETE_CAP_FILE upon an O.CODE_CAP_FILE only if,   | FDP_ACF.1/ADEL |
| (1) S.ADEL is currently selected,   |                |
| (2) no reachable O.JAVAOBJECT, from a package distinct from   |                |
| O.CODE_CAP_FILE that is an instance of a class that belongs to  |                |
| O.CODE_CAP_FILE exists on the card and  |                |
| (3) there is no package loaded on the card that depends on  |                |
| O.CODE_CAP_FILE.  |                |

| ([JCRE3], §11.3.4.3, Applet Package and Contained Instances Deletion). The       | FDP_ACC.2/ADEL |
|--|----------------|
|  | FDP_ACF.1/ADEL |
| O.CODE_CAP_FILE only if,   |                |
| (1) S.ADEL is currently selected,  |                |
| (2) no reachable O.JAVAOBJECT, from a package distinct from                      |                |
| O.CODE_CAP_FILE, which is an instance of a class that belongs to                 |                |
| O.CODE_CAP_FILE exists on the card,  |                |
| (3) there is no package loaded on the card that depends on                       |                |
| O.CODE_CAP_FILE and  |                |
| (4) for every O.APPLET of those being deleted it holds that:                     |                |
| (i) O.APPLET is deselected and   |                |
| (ii) there is no O.JAVAOBJECT owned by O.APPLET such                             |                |
| that either O.JAVAOBJECT is reachable from an applet instance                    |                |
| not being deleted, or O.JAVAOBJECT is reachable from a                           |                |
| package not being deleted, or ([JCRE3],§8.5) O.JAVAOBJECT is                     |                |
| remote reachable.  |                |
| However, the S.ADEL may be granted privileges ([JCRE3], §11.3.5) to bypass the   | FDP_ACF.1/ADEL |
| preceding policies. For instance, the logical deletion of an applet renders it   |                |
| unselectable; this has implications on the management of the associated TSF data |                |
| (see application note of FMT_MTD.1.1/JCRE).                                      |                |
| Only the S.ADEL can delete O.CODE_CAP_FILE or O.APPLET from the card.            | FDP_ACF.1/ADEL |
| Upon deallocation of a resource from the applet instances and/or packages when   | FDP_RIP.1/ADEL |
| one of the deletion operations in FDP_ACC.2.1/ADEL is performed on them,         |                |
| any previous information content of the resource is made unavailable.            |                |
| Requirements on de-allocation during applet/package deletion are described in    | FDP_RIP.1/ADEL |
| [JCRE3], §11.3.4.1, §11.3.4.2 and §11.3.4.3.                                     |                |
| The TSF preserves a secure state when the following types of failures occur: the | FPT_FLS.1/ADEL |
| applet deletion manager fails to delete a package/applet as described in         |                |
| [JCRE3], §11.3.4.  |                |

## 9.1.1.7 SF.ODEL: Object Deletion

| Upon deallocation of the resource from the objects owned by the context of an applet | FDP_RIP.1/ODEL |
|--|----------------|
| instance which triggered the execution of the method                                 |                |
| javacard.framework.JCSystem.requestObjectDeletion(), any previous information        |                |
| content of the resource is made unavailable.   |                |
| The TSF preserves a secure state when the following types of failures occur: the     | FPT_FLS.1/ODEL |
| object deletion functions fail to delete all the unreferenced objects owned by the   |                |
| applet that requested the execution of the method.                                   |                |

## 9.1.1.8 SF.CAR: Secure Carrier

| No one can <b>modify</b> the security attributes <b>AID</b>   | FMT_MSA.1/GP |
|---|--------------|
| Default values for security attributes are:   | FMT_MSA.3/GP |
| <ul><li>User role: none</li><li>Applet checked: No</li><li>DAP Key OK: No</li></ul>                             |              |
| The TSF maintains the roles: Card Manager   | FMT_SMR.1/GP |
| The Card Manager loads applets with their AID.  | FMT_SMF.1/GP |
| The TOE enforces the generation of evidence of origin for transmitted <b>application packages</b> at all times. | FCO_NRO.2/GP |

| The TOE allows:  | FIA_UAU.1/GP                         |
|--|--------------------------------------|
| The TSF shall prevent reuse of authentication data related to the authentication mechanism used to open a secure communication channel with the card.  | FIA_UAU.4/GP                         |
| The TOE allows:  | FIA_UID.1/GP                         |
| Only the user with the security attribute role set to Operator can load an applet.  Only applets with the security attribute Checked set to YES can be transferred.  The DAP key OK security attribute must be set to TRUE to check the integrity and the origin of the applet | FDP_IFC.2/GP-ELF<br>FDP_IFF.1/GP-ELF |
| Package loading is protected against <b>modification</b> , <b>deletion</b> , <b>insertion</b> , <b>and replay</b> errors. If such an error occurs, it is detected at receiption.   | FDP_UIT.1/GP                         |
| New packages can be loaded and installed on the card only on demand of the card issuer. This is done through a GP Secure Channel.  | FTP_ITC.1/GP                         |
| The TSF shall enforce <b>ELF Loading information flow control</b> to permit the rollback of the <b>installation</b> , <b>loading or removal operation</b> on the <b>executable files</b> and <b>application instances</b> .  | FDP_ROL.1/GP                         |
| The TSF shall enforce the ELF Loading information flow control SFP to receive data in a manner protected from unauthorised disclosure.   | FDP_UCT.1/GP                         |

## 9.1.1.9 SF.SCP: Smart Card Platform

| The TSF periodically tests the security mechanisms of the IC. It also checks the integrity of sensitive assets: Applets, PIN and Keys. | FPT_TST.1/SCP |
|--|---------------|
| The TSF resists physical attacks   | FPT_PHP.3/SCP |
| The TSF offers transaction mechanisms  | FPT_RCV.4/SCP |

## 9.1.1.10 SF.CMG: Card Manager

| The Card Manager loads and extradites applets. It also loads GP key.                    | FDP_ACC.1/CMGR  |
|---|-----------------|
|   | FDP_ACF.1/CMGR  |
| No one can modify the security attribute code category                                  | FMT_MSA.1/CMGR  |
| Only restrictive default values can be used for the code category                       | FMT_MSA.3/CMGR  |
| The TSF shall enforce the Data & Key Loading information flow control SFP:              | FDP_IFC.2/GP-KL |
| ☐ ensure that all operations that cause any information in the TOE to flow to and       | FDP_IFF.1/GP-KL |
| from any subject in the TOE are covered by an information flow control SFP;             | FDP_ITC.2/GP-KL |
| and when importing user data, controlled under the SFP, from outside of the TOE.        | FDP_UCT.1/GP    |
| The TSF shall restrict the ability to change_default and query the Life Cycle state to  | FMT_MTD.1/GP-LC |
| the authorized identified roles.  |                 |
| The TSF shall restrict the ability to modify Privileges of an Application or SSD or ISD | FMT_MTD.1/GP-PR |
| to the authorized identified roles.   |                 |
| The TSF shall provide a communication path between itself and the Target                | FTP_TRP.1/GP-TF |
| Application and the Receiving SD that is logically distinct from other communication    |                 |
| paths and provides assured identification of its end points and protection of the       |                 |
| communicated data from modification and disclosure.                                     |                 |

| The TSF shall enforce Data & Key Loading information flow control SFP to permit the rollback of the loading or removal operation on the SD/Application data and keys.   | FDP_ROL.1/GP |
|---|--------------|
| The TSF shall detect when 1 unsuccessful authentication attempts occur related to the authentication of the origin of a card management operation command. When the defined number of unsuccessful authentication attempts has been met or surpassed, the TSF shall close the Secure Channel. | FIA_AFL.1/GP |
| The TSF shall ensure that only secure values are accepted for Life Cycle states, Security Levels and Privileges in the GlobalPlatform Registry.   | FMT_MTD.3/GP |

## 9.1.1.11 SF.APIs: Specific API

| Provides means to application to control execution flow, to detect any failure and to react if required   | FPT_FLS.1/SpecificAPI<br>FDP_IFC.2/GP-KL |
|---|--|
| Provides means to application to execute securely data transfer and comparison, to detect any failure during operation and to react if required | FPT_ITT.1/SpecificAPI                    |
| Provides means to introduce dummy operations leading to unobservability of sensitive operation  | FPR_UNO.1/SpecificAPI                    |

## 9.1.1.12 <u>SF.RND: RNG</u>

| Provide a random value | FCS_RNG.1        |
|------------------------|------------------|
|                        | FCS_RNG.1/GP-SCP |

## 9.1.1.13 <u>SF.CVM: Cardholder Verification Method</u>

| The TSF shall detect when defined number of unsuccessful authentication attempts occur related to user authentication using CVM and block the usage of the Global PIN. | FIA_AFL.1/GP-CVM |
|--|------------------|
| The TSF shall ensure that all users and subjects are unable to observe the operation comparison on Global PIN by S.OPEN  | FPR_UNO.1/GP-CVM |

### 9.1.1.14 <u>SF.DM: Delegated Management</u>

| The TSF shall be able to: generate evidence of receipt for received card management operation requests; relate the the receipt to the Confirmation Data of the recipient, and the parameters of the card management operation; verify the evidence of receipt of information to recipient given.                                    | FIA_AFL.1/GP-CVM     |
|---|----------------------|
| The TSF shall enforce the generation of evidence of origin, be able to: relate the token of the originator of the information the information to which the evidence applies and verify the evidence of origin of information to the off-card entity (recipient of the evidence of origin) when ELF with Token is received.          | FCO_NRO.2/GP-TOKEN   |
| The TSF shall perform the verification of the Token signature.  | FCS_COP.1/GP-TOKEN   |
| The TSF shall perform the generation of the Receipt signature   | FCS_COP.1/GP-RECEIPT |
| The TSF shall be able to generate evidence of receipt for received card management operation requests. The TSF shall also be able to relate the Confirmation Data of the recipient of the information, and the parameters of the card management operation request and shall provide a capability to verify the evidence of receipt | FCO_NRR.1/GPRECEIPT  |

ST

# MultiApp V5.1: GP-SE Security Target

## 9.1.1.15 SF.DAP: DAP Verification and Mandated DAP Verification

| The TSF shall perform computation of a hash value for DAP Verification.              | FCS_COP.1/GP-DAP_SHA |
|--|----------------------|
| The TSF shall perform verification of the DAP signature attached to Load Files.      | FCS_COP.1/GP-DAP_VER |
| The TSF shall:   | FCO_NRO.2/GP-DAP     |
| enforce the generation of evidence of origin for transmitted 'ELF with DAP' relate   |                      |
| the Load File Data Block Signature and the 'ELF with DAP of the information to       |                      |
| which the evidence applies. provide a capability to verify the evidence of origin of |                      |
| information to the off-card entity given at the time the ELF with DAP is received.   |                      |

## 9.1.1.16 SF.OSAGILITY: OS Agility Management

| Provides the role management as defined in  | FMT_SMR.1/OS-UPDATE     |
|---|-------------------------|
| Provides Patch management functions linked to the states of the TOE as defined      | FMT_SMF.1/OS-UPDATE     |
| in  |                         |
| The TSF maintains the following list of security attributes belonging to individual | FIA_ATD.1/OS-UPDATE     |
| users:  |                         |
| additional code ID for each activated additional code                               |                         |
| The OS Update module load, install and activate the additional code                 | FDP_ACC.1/OS-UPDATE     |
|   | FDP_ACF.1/OS-UPDATE     |
| The default values for security attributes are defined by the OS Update Access      | FMT_MSA.3/OS-UPDATE     |
| Control Policy  |                         |
| Provides a communication path between itself and remote                             | FTP_TRP.1/OS-UPDATE     |
| It provides the secure transfer of data through SM as defined in                    | FCS_COP.1/OS-UPDATE-VER |
|   | FCS_COP.1/OS-UPDATE-DEC |
| Provides physical protection of the TOE and preservation of TOE secure state as     | FPT_FLS.1/OS-UPDATE     |
| defined in  |                         |

## 9.1.2 SF provided by MultiApp V5.1 PACE Module

| SF          | Description                                  |
|-------------|--|
| SF.REL      | Protection of data                           |
| SF.AC       | Access control                               |
| SF.SYM_AUTH | Symmetric authentication                     |
| SF.SM       | Secure messaging                             |
| SF.PERSO    | Provides service for Personalization of data |
|             | in used in PACE                              |

Table 57: Security Functions provided by the MultiApp V5.1 with PACE

The SF.REL function provides the protection of data on the TOE as detailed in next table.

| Provides physical protection of the TOE and preservation of TOE secure state as defined in | FPT_PHP.3; FPT_FLS.1                |
|--|-------------------------------------|
| Addresses the inherent leakage to TOE cryptographic operation                              | FPT_EMS.1                           |
| Provides the TOE test mechanisms as defined in   | FPT_TST.1                           |
| Provides protection against misuse of TOE test features as defined in                      | FMT_LIM.1/PERSO and FMT_LIM.2/PERSO |

The SF.AC function provides the access control of the TOE as listed in next table.

| Provides TOE access control to specific data as defined in                  | FMT_MTD.1/INI_ENA,           |
|---|------------------------------|
|   | FMT_MTD.1/INI_DIS,           |
|   | FMT_MTD.1/Initialize_PINPUK, |
|   | FMT_MTD.1/Resume_PINPUK,     |
|   | FMT_MTD.1/Change_PIN,        |
|   | FMT_MTD.1/Unblock_ PIN       |
| Provides no access to specific data as defined in                           | FMT_MTD.1/KEY_READ           |
| Provides the role management as defined in                                  | FMT_SMR.1/PACE               |
|   | FMT_SMR.1/PERSO              |
| Provides management functions linked to the states of the TOE as defined in | FMT_SMF.1/PERSO              |
|   | FMT_SMF.1/PACE               |

The SF.SYM\_AUTH function provides the symmetric authentication functions to the TOE as listed in next table.

| It encompasses the PACE identification and authentication as defined in | FIA_UID.1/PACE<br>FIA_UAU.1/PACE<br>FIA_UAU.4/PACE<br>FIA_UAU.5/PACE<br>FIA_UAU.6/PACE |
|---|--|
| It manages error in SM establishment as defined in                      | FIA_AFL.1/PACE   |
| The role authentication as requested by                                 | FMT_SMR.1/PACE   |

The SF.SM function provides the secure messaging of the TOE as listed in next table.

| It provides the establishment of SM as defined in | FCS_CKM.1/DH_PACE, |
|---|--------------------|
|   | FTP_ITC.1/PACE     |
|   | FCS_RNG.1/PACE     |

ST

# MultiApp V5.1: GP-SE Security Target

| It provides the secure transfer of data through SM as defined in         | FCS_COP.1/PACE_ENC<br>FCS_COP.1/PACE_MAC<br>FCS_COP.1/PACE_CAM |
|--|--|
| It performs the erasure of session keys and sensitive data as defined in | FCS_CKM.4/PACE and FDP_RIP.1/PACE.                             |

## The SF.PERSO function provides the service to personalize the TOE as listed in next table.

| It provides the nonce and session key for SM for personalization operation as defined in | FCS_RNG.1/PACE, |
|--|-----------------|
|  | FCS_CKM.1/PERSO |
| It provides the establishment of SM and manage error as defined in                       | FIA_AFL.1/PERSO |
| It provides the identification and authentication in personalisation phase as defined in | FIA_UID.1/PERSO |
|  | FIA_UAU.1/PERSO |
|  | FMT_SMR.1/PERSO |
| It provides secure import of sensitive data using crypto mechanisms                      | FMT_SMF.1/PERSO |
|  | FCS_COP.1/PERSO |
| It performs the erasure of session keys and sensitive data as defined in                 | FCS_CKM.4/PACE  |
|  | and             |
|  | FDP_RIP.1/PACE  |

## 9.1.3 TSFs provided by the AQUARIUS\_CA\_09

The evaluation is a composite evaluation and uses the results of the CC evaluation provided by [CR-IC]. The IC and its primary embedded software have been evaluated at level EAL 6+. These SF are the same for the IC considered in this ST;

| s ST;            |   |
|------------------|---|
| SF               | Description   |
| SF_PMODE         | Manages the different steps of the product life cycle. At each step (boot mode, test mode and user mode), registers, data and memories accesses are limited or not. This allows to restrict product access according to the step (from manufacturing phase to final user phase). In addition, it is not possible to come back to test mode after the deployment of the product. |
| SF_AUDIT_STORAGE | Allows to store specific data which shall remain permanent in the system such as the unique identification of the product stored in the Flash memory, pre-personalization data and security information.  |
| SF_AUTHENT       | Provides mutual authentication between the TOE and the "Terminal" based on cryptographic mechanisms. Authentication is done before the loading operation.   |
| SF_CONF_INT      | Provides confidentiality and integrity to data stored in the memories (ROM, RAM, FLASH), in registers and in buses. The SF_CONF_INT prevents the disclosure of internal user data thanks to:  Memories encryption.  Buses encryption.  Register masking and cycling.  Address scrambling.  Integrity mechanisms on memories, buses and registers.                               |
| SF_EXEC          | Provides protection against an un-correct execution of the code such as:  Mechanisms to detect code re-routing.  Mechanisms to detect illegal opcode execution.  Mechanisms to control the operating conditions.  In case of detection of an abnormal execution, an alarm is sent.  Ensures also the correct operating conditions of the product during the                     |
| SF_MEM_ACCESS    | execution and prevents any malfunction using sensors.  Provides:  A Memory Protection Unit (MPU) that defines access permission on different memories areas.  A Flash Protection Unit that defines access permission on NVR areas. Provides also an access control to user data stored in Flash during the deployment of the Loader and after.                                  |
| SF_PHY_PRO       | Provides physical protection to the product against physical manipulation and physical probing. The following features are used:  - Active Shield Countermeasures added during the layout design.   |
| SF_ALARM         | Enables to trig either an interrupt or a hardware reset. This TSF provides preservation of secure state in case of exposure to operation conditions which are not tolerated.  |

ST

| i           |   |
|-------------|---|
| SF_RANDOM   | Provides mechanisms to prevent access to sensitive assets during the use by the Secure Embedded Software thanks to:  • Generate variation of the clock frequency around a range of frequency.  • Randomize the clock stealer.  Randomize the execution of the commands. |
| SF_RNG      | Provides a random number generator (PTRNG) that meets PTG.2 class of BSI-AIS31 (German Scheme). It is used for key generation or for security measures.   |
| SF_SEC_LOAD | Allows to load some code in the product in a secure way and, after the loading, to lock the loading mechanism.  |

Table 58: Security Functions provided by the THALES DIS France SAS AQUARIUS\_CA\_09 chips These SF are described in [AQU-IC].

#### 9.2 ASSURANCE MEASURES

| Assurance<br>Measure                    | Document title                            |
|---|---|
| *************************************** |   |
| AM_ASE                                  | MultiApp V5.1 JCS Security Target         |
| AM_ADV_Spec                             | Functional Specifications - MultiApp V5.1 |
| AM_ADV_Design                           | Design – MultiApp V5.1                    |
| AM_ADV_Int                              | Internals – MultiApp V5.1                 |
| AM_ALC                                  | Class ALC – MultiApp V5.1                 |
| AM_AGD                                  | Guidance – MultiApp V5.1                  |
| AM_ATE                                  | Class ATE – MultiApp V5.1                 |
| AM_CODE                                 | Source Code – MultiApp V5.1               |
| AM_Samples                              | Samples – MultiApp V5.1                   |

Table 59: Assurance Measures.

The development team uses a configuration management system that supports the generation of the TOE. The configuration management system is well documented and identifies all different configuration items. The configuration management tracks the implementation representation, design documentation, test documentation, guidance documentation. The security of the configuration management is described in detail in a separate document. The delivery process of the TOE is well defined and follows strict procedures. Several measures prevent the modification of the TOE based on the developer's master copy and the user's version. The Administrator and the User are provided with necessary documentation for initialization and start-up of the TOE.

The implementation is based on an informal design of the components of the TOE. The description is sufficient to generate the TOE without other design requirements.

The correspondence of the Security Functional Requirements (SFR) with less abstract representations will be demonstrated in a separate document. This addresses ADV ARC, ADV FSP, ADV IMP, and ADV TDS.

The tools used in the development environment are appropriate to protect the confidentiality and integrity of the TOE design and implementation. The development is controlled by a life cycle model of the TOE. The development tools are well defined and documented.

The Thales DIS R&D organization is equipped with organizational and personnel means that are necessary to develop the TOE.

As the evaluation is identified as a composite evaluation based on the CC evaluation of the hardware, the assurance measures related to the hardware (IC) will be provided by documents of the IC manufacturer.

### **END OF DOCUMENT**
