Document Introduction

This document provides the basis for an evaluation of a specific Target of Evaluation (TOE), the McAfee Web Gateway Version 7.0.1.1. This Security Target (ST) defines a set of assumptions about the environment, a list of threats that the product intends to counter, a set of security objectives, a set of security requirements, and the IT security functions provided by the TOE which satisfy the set of requirements.

1 Security Target Introduction

This Security Target has been written to support the evaluation of McAfee Web Gateway (MWG) software version 7.0.1.1. The primary purpose of MWG is to serve as a web gateway, mediating traffic between an enterprise and the internet.

This introductory section presents security target (ST) identification information and an overview of the ST structure. A brief discussion of the ST development methodology is also provided.

A ST document provides the basis for the evaluation of an information technology (IT) product or system (e.g., target of evaluation (TOE)). An ST principally defines:

a) A set of assumptions about the security aspects of the environment, a list of threats which the product is intended to counter, and any known rules with which the product must comply (in Section 3, Security Environment).

b) A set of security objectives and a set of security requirements to address that problem (in Sections 4 and 5, Security Objectives and IT Security Requirements, respectively).

c) The IT security functions provided by the TOE which meet that set of requirements (in Section 6, TOE Summary Specification).

d) Protection Profile claims and overall ST rationale (Sections 7 and 8, respectively).

The structure and contents of this ST comply with the requirements specified in the CC, Part 1, Annex B, and Part 3, Chapter 10.

1.1 ST and TOE Identification

This section provides ST and TOE identification information.

ST Title: McAfee Web Gateway Version 7.0.1.1 EAL2 +ALC_FLR.2 Security Target

ST Author: Primasec Ltd.

ST Revision Number: 86-0948031-J

ST Date: Sep 2010

TOE Identification: Software:

McAfee Web Gateway Software Version 7.0.1.1
Administrative Guidance for receiving, installing and managing the TOE

Product Guide McAfee Web Gateway version 7.0.1

Quick Start McAfee Web Gateway, part number 700-2513A00

Assurance Level: EAL2, augmented with ALC_FLR.2

1.2 Conventions, Terminology, and Acronyms

This section identifies the formatting conventions used to convey additional information and terminology having specific meaning. It also defines the meanings of abbreviations and acronyms used throughout the remainder of the document.

1.2.1 Conventions

This section describes the conventions used to denote CC operations on security requirements and to distinguish text with special meaning. The notation, formatting, and conventions used in this ST are largely consistent with those used in the CC. Selected presentation choices are discussed here to aid the Security Target reader.

The CC identifies four operations to be performed on functional requirements; assignment, iteration, refinement, and selection are defined by Part 2 of the CC.

a) The refinement operation is used to add detail to a requirement, and thus further restricts a requirement. Refinement of security requirements is denoted by bold text for additions and strike-through to indicate deletions.

b) The selection operation is used to select one or more options provided by the CC in stating a requirement. Selections are denoted by underlined italicized text.

c) The assignment operation is used to assign a specific value to an unspecified parameter, such as the length of a password. Assignment is indicated by showing the value in square brackets, [assignment_value].
d) The **iteration** operation is used when a component is repeated with varying operations. Showing the iteration number in parenthesis following the component identifier and element identifier (iteration_number) denotes iteration.

### 1.2.2 Terminology

In the Common Criteria, many terms are defined in Section 2.3 of Part 1. The following terms are a subset of those definitions. They are listed here to aid the user of the Security Target.

**User**
- Any entity (human user or external IT entity) outside the TOE that interacts with the TOE.

**Human user**
- Any person who interacts with the TOE.

**External IT entity**
- Any IT product or system, untrusted or trusted, outside of the TOE that interacts with the TOE.

**Role**
- A predefined set of rules establishing the allowed interactions between a user and the TOE.

**Identity**
- A representation (e.g., a string) uniquely identifying an authorized user, which can either be the full or abbreviated name of a user or a pseudonym.

**Authentication data**
- Information used to verify the claimed identity of a user.

In addition to the above general definitions, this Security Target provides the following specialized definitions:

**Authorized Administrator** – A role which human users may be associated with to administer the security parameters of the TOE. Such users are not subject to any access control requirements once authenticated to the TOE and are therefore trusted to not compromise the security policy enforced by the TOE.

### 1.2.3 Acronyms

The following abbreviations from the Common Criteria are used in this Security Target:

- **CC** Common Criteria for Information Technology Security Evaluation
- **EAL** Evaluation Assurance Level
- **IGS** Installation, Generation and Startup
- **IT** Information Technology
1.3 References

The following documentation was used to prepare this ST:

1.4 Common Criteria Conformance Claims

The TOE does not claim conformance to any Protection Profile.

The TOE conforms to [CC_PART2] and [CC_PART3] conformant with the assurance level of EAL2, augmented with ALC_FLR.2.
2 TOE Description

McAfee Web Gateway (MWG) software is typically deployed as a web gateway between the internet and the enterprise. MWG provides filters which adapt traffic for various internet protocols including HTTP, HTTPS, and FTP. When it is installed in an FTP system, every transaction is piped through it for filtering and malware scanning on the content.

Figure 1 Typical McAfee Web Gateway Application
2.1 Product Type

MWG functions as a web gateway to examine and adapt network traffic through a variety of filters to meet the needs of an enterprise. MWG protects against inbound threats such as malware hidden in blended content and it protects organizations from outbound threats such as the potential loss of confidential information that can leak out on web protocols.

2.2 Product Description

The MWG product is available as a turn-key network appliance. The hardware platforms for the family of MWG appliance models are scaled to provide a range of performance capability to match the needs of the enterprise. The MWG appliances come completely preinstalled with software and a proven default configuration for rapid deployment. The software is self-contained and includes hardened OS features taken from McAfee Linux Operating System (MLOS) 1.0.

2.3 Product Features

MWG implements the following User Data Protection features:

• URL Filtering to control access to Web content
• Anti-Malware filtering for threats transported in Web and FTP traffic
• HTTPS scanning for malicious content hidden in encrypted internet protocol traffic
• Certificate Verification to control access to HTTPS content

The management features provided by MWG include the following:

• Granular Security Policy Management: A graphical user interface provides flexible and custom policy management.
• Audit Review: the graphical user interface provides authorized administrators with convenient access to audit information.
• Forensic Analysis: Report generation tools can be used to ascertain information about historical and current attacks.

2.4 Application Context

MWG operates in a network environment with web-based traffic. It provides gateway protection between at least two networks. Typically, one network is viewed as the inside of an organization, where there is some assumption of control over access to the computing network. The other network is typically viewed as an external network, such as the
Internet, where there is no practical control over the actions of its processing entities. MWG's role is to examine and adapt traffic flowing between the two networks.

2.5 Security Environment TOE Boundary

2.5.1 Security Features to be Evaluated

The MWG scope of evaluation includes URL filtering, Anti-Malware, HTTPS scanning and Certificate verification. Other traffic filtering services provided by MWG are excluded from the scope of the evaluation.

2.5.2 Features not to be Evaluated

MWG provides the following functionality that is specifically excluded from the scope of this evaluation:

a) Instant Message Protocol
b) Remote administration from connected networks
c) Cluster Management
d) Multiple Authentication Mechanisms
e) High availability
f) ICAP
g) Transparent router and transparent bridge modes
h) Use of multiple administrator roles
i) Use of ePolicy Orchestrator
j) Kerberos administration
Figure 2 McAfee Web Gateway TOE Security Environment
2.5.3 Physical Scope and Boundary

The TOE consists of MWG Software Version 7.0.1.1. This software is fully integrated; it includes OS features that were built from MLOS, a Tomcat application server, and OpenSSL cryptographic capability. This software is obtained by purchasing a MWG appliance from McAfee Corporation. The hardware appliance platform is not part of the TOE; it is part of the IT environment. The TOE includes a management GUI that can be accessed from a variety of commercially available Web browsers that can run HTTPS. The management browser software runs on a local, generic computing platform with a Windows operating system; however, the platform, the browser, and the Windows OS are not part of the TOE.

2.5.4 Evaluated TOE Configuration

The MWG software is installed on a MWG appliance computing platform with at least three network interfaces. Two network communication interfaces are provided (generally to separate internal and external networks) and a third is typically used for communication with the management browser. Even though MWG can communicate with an administrative browser on any connected network; the evaluated configuration binds administration to the isolated management network (or to the internal network if the appliance hardware only includes two network connections).

The TOE software version is available and executes properly across the entire family of MWG appliance models: WW500, WW1100, WW1900, WW2900, WG5000 and WG5500. The software also executes properly in a virtual environment under VMware ESX, ESXi or VMware Workstation (version 5.5 or later).

The evaluated configuration is comprised of TOE software running on a MWG appliance or virtual platform, the generic Windows based administrative workstation running Firefox, and the associated network interconnections. These components are maintained in a physically protected IT environment that prohibits unauthorized access.

2.5.4.1 Hardware Security Considerations

No extraordinary security demands are placed upon the hardware platforms and peripheral equipment used by the MWG software. This equipment or virtual environment is expected to meet the customary demands for reliable operation of typical Unix or Microsoft Servers as provided by standard Intel PC computing platforms. If any of the
network interface cards support features such as wake-on LAN, special external command features, or special protocol processing, the hardware connections to support those features should not be connected. In the evaluated configuration, MWG will not enable any such special features.

2.5.5 Logical Scope and Boundary

The TOE with support from the IT environment provides the following security features:

a) Security Management [SW_FMT]
b) Identification and Authentication [SW_FIA]
c) User Data Protection [SW_FDP]
d) Protection of Security Functions [SW_FPT]

e) Audit [SW_FAU]

2.5.5.1 Security Management [FMT]

An administrator uses a browser running on a Windows computer (part of the IT environment) to perform management functions on MWG. This administrative workstation communicates with MWG via one of the networks connected to MWG.

2.5.5.2 Identification and Authentication [FIA]

The MWG TOE, along with support from the IT environment, supports password authentication for administrative users. MWG consults its stored user information, determines the password’s validity, and enforces the result of the validity check.

2.5.5.3 User Data Protection [FDP]

For the MWG TOE, user data refers only to internet protocol traffic passed through MWG. MWG rules implement a site's security policy and, ultimately, determine what filters will be applied to the IP traffic before it is allowed to flow to another network.

2.5.5.4 Protection of Security Functions [FPT]

The MWG TOE provides a reliable time mechanism which is of particular importance for audit and for the sequencing of security related activity.
2.5.5.5 Audit [FAU]

MWG provides an audit log to which key security processes may write audit data. MWG adds security relevant information, such as the time and the identity of the generating process, when logging audit data.

MWG audit includes administration activity as well as communication activity with results (traffic passes or not).

Only authorized administrators are allowed to read the audit data stream. MWG provides facilities to generate a few standard reports as well as a means to produce custom reports, or to view selected audit events. MWG also includes facilities to monitor and free up audit space at appropriate times.
3 TOE Security Environment

This section describes the security problem that the TOE is intended to solve. This includes information about the security aspects of the physical environment, personnel access, and network connectivity of the TOE.

Assumptions about the security aspects of the environment and manner of use are identified.

Known or assumed threats to the assets protected by the TOE or the TOE IT and operating environments are described.

Organization security policy (OSP) statements or rules to which the TOE must comply or implement are identified.

The TOE is intended to be used in environments in which sensitive information is processed, or where the sensitivity level of information in both the internal and external networks is different.

3.1 Assumptions

The TOE is assured to provide effective security measures when installed, managed, and used correctly. The operational environment must be managed in accordance with assurance requirement documentation for delivery, operation, and user/administrative guidance. Only authorized administrators are allowed physical access to the TOE and its management workstation. The TOE, the management workstation, and the administrative communication path are all managed in a physically secure environment with no remote access.

3.1.1 TOE Assumptions

The TOE claims the assumptions in the table below:

<table>
<thead>
<tr>
<th>Assumption Identifier</th>
<th>Assumption Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.PHYSEC</td>
<td>The TOE and local administration platform are physically secure.</td>
</tr>
<tr>
<td>A.PUBLIC</td>
<td>The TOE and local administration platform do not host public data.</td>
</tr>
<tr>
<td>A.NOEVIL</td>
<td>Authorized administrators are non-hostile and follow all administrator guidance; however, they are capable of error.</td>
</tr>
<tr>
<td>A.SINGEN</td>
<td>Information can not flow between the internal and external networks unless it passes through the TOE.</td>
</tr>
<tr>
<td>A.PROLIN</td>
<td>The communication path between the TOE</td>
</tr>
</tbody>
</table>
Assumption Identifier | Assumption Description
------------------------|-----------------------------
| and the local administration workstation (browser) is physically protected.
A.NOREMO | Human users who are not authorized administrators cannot directly or remotely access the local administration platform.
A.BENIGN | The Windows OS running on the local administration platform will provide necessary computing services, but will not tamper with browser communications with the TOE.

### 3.2 Threats

This section helps define the nature and scope of the security problem by identifying assets that require protection, as well as threats to those assets.

Threats may be addressed by the TOE or by the TOE operating environment.

#### 3.2.1 Threats Addressed by the TOE

The TOE addresses all threats listed in the following table. The threat agents are either unauthorized persons or external IT entities not authorized to use the TOE itself.

<table>
<thead>
<tr>
<th>Threat Identifier</th>
<th>Threat Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>T.NOAUTH</td>
<td>An unauthorized person may attempt to bypass the security of the TOE so as to access and use security functions and/or non-security functions provided by the TOE.</td>
</tr>
<tr>
<td>T.MEDIAT</td>
<td>An unauthorized person may send impermissible information through the TOE, which results in the exploitation of resources on the internal network.</td>
</tr>
<tr>
<td>T.AUDACC</td>
<td>Persons may not be accountable for the actions that they conduct because the audit records are not reviewed, thus allowing an attacker to escape detection.</td>
</tr>
<tr>
<td>T.SELPRO</td>
<td>An unauthorized person may read, modify, or destroy security critical TOE configuration data.</td>
</tr>
</tbody>
</table>
### 3.2.2 Threats Addressed by the TOE Operating Environment

The following threats are addressed by the TOE operating environment.

**Table 3. Threats Addressed by the TOE Operating Environment**

<table>
<thead>
<tr>
<th>Threat Identifier</th>
<th>Threat Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>T.AUDFUL</td>
<td>An unauthorized person may cause audit records to be lost or prevent future records from being recorded by taking actions to exhaust audit storage capacity, thus masking an attacker's actions.</td>
</tr>
<tr>
<td>TE.TUSAGE</td>
<td>The TOE may be inadvertently configured, used, and administered in an insecure manner by either authorized or unauthorized persons.</td>
</tr>
</tbody>
</table>

### 3.3 Organizational Security Policies

This ST does not identify any OSPs.
4 Security Objectives

The purpose of the security objectives is to detail the planned response to a security problem or threat. Threats can be directed against the TOE or the security environment or both. The CC identifies two categories of security objectives:

a) Security objectives for the TOE, and
b) Security objectives for the Operating Environment

4.1 Security Objectives for the TOE

The TOE accomplishes the following security objectives:

Table 4. Security Objectives for the TOE

<table>
<thead>
<tr>
<th>Objective Identifier</th>
<th>Objective Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>O.IDAUTH</td>
<td>The TOE must uniquely identify and authenticate the claimed identity of all users, before granting a user access to TOE functions.</td>
</tr>
<tr>
<td>O.MEDIAT</td>
<td>The TOE must mediate the flow of all information between IT devices located on internal and external networks governed by the TOE, disallowing passage of data identified as inappropriate.</td>
</tr>
<tr>
<td>O.SECSTA</td>
<td>Upon initial start-up of the TOE or recovery from an interruption in TOE service, the TOE must not compromise its resources or those of any connected network.</td>
</tr>
<tr>
<td>O.SELPRO</td>
<td>The TOE must protect itself against attempts by unauthorized users to bypass, deactivate, or tamper with TOE security functions.</td>
</tr>
<tr>
<td>O.AUDREC</td>
<td>The TOE must provide a means to record a readable audit trail of security-related events, with accurate dates and times, and a means to search the audit trail based on relevant attributes.</td>
</tr>
<tr>
<td>O.ACCOUN</td>
<td>The TOE must provide user accountability for information flows through the TOE and for authorized administrator use of security functions related to audit.</td>
</tr>
<tr>
<td>O.SECFUN</td>
<td>The TOE must provide functionality that enables an authorized administrator to use the TOE security functions, and must ensure that only authorized...</td>
</tr>
</tbody>
</table>
### Security Objectives for the Environment

All the assumptions stated in Section 3.1 are considered to be security objectives for the environment. The following are the security objectives that are to be satisfied without imposing technical requirements on the TOE. That is, they will not require the implementation of functions in the TOE software. They will be satisfied largely through application of procedural or administrative measures.

**Table 5. Security Objectives for the TOE Operating Environment**

<table>
<thead>
<tr>
<th>Objective Identifier</th>
<th>Objective Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OE.PHYSEC</td>
<td>The TOE is physically secure.</td>

5 TOE IT Security Requirements

This section provides functional and assurance requirements that must be satisfied by a Security Target-compliant TOE.

5.1 TOE Security Requirements

5.1.1 TOE Security Functional Requirements

The security functional requirements for this Security Target consist of the following components from Part 2 of the CC, summarized in Table 6.

Table 6. TOE Security Functional Requirements

### Requirements Overview

5.1.1.1 **Comprehensive Listing of all TOE SFRs**

FMT_SMR.1 Security roles

53. FMT_SMR.1.1 - The TSF shall maintain the **roles** [authorized administrator].

54. FMT_SMR.1.2 - The TSF shall be able to associate users with the **roles**.

FIA_ATD.1 User attribute definition

55. FIA_ATD.1.1 - The TSF shall maintain the following list of security attributes belonging to individual users:
   
   a) [identity;
   
   b) association of a human user with the authorized administrator role;
   
   c) and password].

FIA_UID.2 User identification before any action

56. FIA_UID.2.1 - The TSF shall require each user to identify itself before allowing any other TSF-mediated actions on behalf of that user.

FIA_UAU.2 User authentication before any action

57. FIA_UAU.2.1 - The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

58. **Requirements Overview:** This Security Target consists of multiple information flow control Security Function Policies (SFPs). The CC allows multiple policies to exist, each having a unique name. This is...
accomplished by iterating FDP_IFC.1 for each of the four named information flow control policies.

59 The first policy is called the URL SFP. The subjects under control of this policy are external IT entities on an internal or external network sending HTTP traffic that is passed through the TOE prior to being forwarded to other external IT entities. This traffic may be filtered based upon the designated URLs.

60 The second policy is called the MALWARE SFP. The subjects under control of this policy are external IT entities sending IP traffic content that is passed through the TOE prior to being forwarded to other IT entities. This content may be filtered for malware.

61 The third policy is called the CERTIFICATE SFP. The subjects under control of this policy are external IT entities sending IP traffic content that is passed through the TOE prior to being forwarded to other IT entities. This content may be filtered for certificate characteristics.

62 The fourth policy is called the HTTPS SFP. The subjects under control of this policy are external IT entities on an internal or external network sending HTTPS traffic that is passed through the TOE prior to being forwarded to other external IT entities. This traffic may be decrypted for processing by the other SFPs, prior to being re-encrypted and forwarded.

63 The information flowing between subjects in these policies is traffic with attributes, defined in FDP_IFF.1.1. The rules that define each information flow-control SFP are found in FDP_IFF.1.2. Component FDP_IFF.1 is iterated to correspond to each of the iterations of FDP_IFC.1.

FDP_IFC.1 Subset information flow control (1)

64 FDP_IFC.1.1 - The TSF shall enforce the [URL SFP] on:
   a) [subjects: external IT entities that send and receive information that is passed through the TOE to one another;]
   b) information: web traffic passed through the TOE; and
   c) operation: pass information].

FDP_IFC.1 Subset information flow control (2)

65 FDP_IFC.1.1 - The TSF shall enforce the [MALWARE SFP] on:
   a) [subjects: external IT entities that send and receive IP traffic content that is passed through the TOE to one another;]
   b) information: web traffic content passed through the TOE; and
   c) operation: pass information].

FDP_IFC.1 Subset information flow control (3)
FDP_IFC.1.1 - The TSF shall enforce the [CERTIFICATE SFP] on:

a) [subjects: external IT entities that send and receive IP traffic content that is passed through the TOE to one another;]

b) information: HTTP traffic content passed through the TOE; and

c) operation: pass information].

FDP_IFC.1.1 - The TSF shall enforce the [HTTPS SFP] on:

a) [subjects: external IT entities that send and receive HTTPS traffic that is passed through the TOE to one another;]

b) information: HTTPS traffic passed through the TOE; and

c) operation: decrypt information for filtering by other SFPs].

FDP_IFF.1.1 - The TSF shall enforce the [URL SFP] based on at least the following types of subject and information security attributes:

a) [subject security attributes:

• Presumed address;]

b) information security attributes:

• presumed address of source subject;

• URL requested in HTTP message; and

• Category of the requested URL].

FDP_IFF.1.2 - The TSF shall permit an information flow between a controlled subject and another controlled subject via a controlled operation if the following rules hold:

[all the information security attribute values are unambiguously permitted by the information flow security policy rules, where such rules may be composed from combinations of the values of the information flow security attributes, created by the authorized administrator].

FDP_IFF.1.3 - The TSF shall enforce the [none].

FDP_IFF.1.4 - The TSF shall provide the following [none].

FDP_IFF.1.5 - The TSF shall explicitly authorize an information flow based on the following rules: [none].

FDP_IFF.1.6 - The TSF shall explicitly deny an information flow based on the following rules: [none].

FDP_IFF.1 Simple security attributes (2)
FDP_IFF.1.1 - The TSF shall enforce the [MALWARE SFP] based on at least the following types of subject and information security attributes:

a) [subject security attributes:
   • none;

b) information security attributes:
   • Traffic content].

FDP_IFF.1.2 - The TSF shall permit an information flow between a controlled subject and another controlled subject via a controlled operation if the following rules hold:

[traffic content does not violate any Anti-Malware searches that have been activated by the authorized administrator].

FDP_IFF.1.3 - The TSF shall enforce the [none].

FDP_IFF.1.4 - The TSF shall provide the following [none].

FDP_IFF.1.5 - The TSF shall explicitly authorize an information flow based on the following rules: [none].

FDP_IFF.1.6 - The TSF shall explicitly deny an information flow based on the following rules: [none].

FDP_IFF.1 Simple security attributes (3)

FDP_IFF.1.1 - The TSF shall enforce the [CERTIFICATE SFP] based on at least the following types of subject and information security attributes:

a) [subject security attributes:
   • none;

b) information security attributes:
   • Certificate Characteristics (validity, lifetime, name, chain)].

FDP_IFF.1.2 - The TSF shall permit an information flow between a controlled subject and another controlled subject via a controlled operation if the following rules hold:

[certificate characteristics satisfies the rules established by the authorized administrator].

FDP_IFF.1.3 - The TSF shall enforce the [none].

FDP_IFF.1.4 - The TSF shall provide the following [none].

FDP_IFF.1.5 - The TSF shall explicitly authorize an information flow based on the following rules: [none].
FDP_IFF.1 Simple security attributes (4)

FDP_IFF.1.1 - The TSF shall enforce the [HTTPS SFP] based on at least the following types of subject and information security attributes:

a) [subject security attributes:
   • none;

b) information security attributes:
   • Traffic content].

FDP_IFF.1.2 - The TSF shall permit an information flow between a controlled subject and another controlled subject via a controlled operation if the following rules hold:

[the authorized administrator has activated HTTPS termination and the decrypted message satisfies all other security policies that have been specified by the authorized administrator].

FDP_IFF.1.3 - The TSF shall enforce the [none].

FDP_IFF.1.4 - The TSF shall provide the following [none].

FDP_IFF.1.5 - The TSF shall explicitly authorize an information flow based on the following rules: [none].

FDP_IFF.1.6 - The TSF shall explicitly deny an information flow based on the following rules: [none].

Application Note: MWG uses OpenSSL FIPS Object Module Version 1.1.2 (FIPS 140-2 certificate 918) for https encryption and decryption.

FCS_COP.1 Cryptographic operation (1)

FCS_COP.1.1(1) – The TSF shall perform [symmetric encryption and decryption] in accordance with a specified cryptographic algorithm [3DES or AES] and cryptographic key sizes [168 bits 3DES or up to 256 bits AES] that meet the following: [NIST Special Publication 800-67 (3DES) or FIPS 197 (AES)].

FCS_COP.1 Cryptographic operation (2)

FCS_COP.1.1(2) – The TSF shall perform [asymmetric encryption and decryption] in accordance with a specified cryptographic algorithm [RSA] and cryptographic key sizes [up to 4096 bits] that meet the following: [PKCS#1 v2.1].

FCS_CKM.1 Cryptographic key generation (1)

FCS_CKM.1.1(1) – The TSF shall generate symmetric cryptographic keys in accordance with a specified key generation algorithm [FIPS
Approved random number generator] and specified cryptographic key sizes [168 bits 3DES or up to 256 bits AES] that meet the following: [ANSI X9.31].

FCS_CKM.1 Cryptographic key generation (2)

FCS_CKM.1.1(2) – The TSF shall generate asymmetric cryptographic keys in accordance with a specified key generation algorithm [FIPS Approved random number generator] and specified cryptographic key sizes [up to 4096 bits] that meet the following: [ANSI X9.62].

FCS_CKM.4 Cryptographic key destruction

FCS_CKM.4.1 – The TSF shall destroy cryptographic keys in accordance with a specified key destruction method [overwriting] that meets the following: [FIPS 140-2].

FMT_MSA.1 Management of security attributes

FMT_MSA.1.1 - The TSF shall enforce the [URL SFP, MALWARE SFP, CERTIFICATE SFP, and HTTPS SFP] to restrict the ability to [delete and create] the security attributes [information flow rules described in FDP_IFF.1(1-4)] to [the authorized administrator].

FMT_MSA.3 Static attribute initialization

FMT_MSA.3.1 - The TSF shall enforce the [URL SFP, MALWARE SFP, CERTIFICATE SFP, and HTTPS SFP] to provide restrictive default values for security attributes that are used to enforce the SFP.

FMT_MSA.3.2 - The TSF shall allow the [authorized administrator] to specify alternative initial values to override the default values when an object or information is created.

Application Note: Following TOE installation, the default configuration is to restrict traffic using URL filtering and malware filtering.

FMT_MTD.1 Management of TSF data (1)

FMT_MTD.1.1(1) - The TSF shall restrict the ability to query, modify, delete, [and assign] the [user attributes defined in FIA_ATD.1.1] to [the authorized administrator].

FMT_MTD.1 Management of TSF data (2)

FMT_MTD.1.1(2) - The TSF shall restrict the ability to modify the [time and date used to form the timestamps in FPT_STM.1.1] to [the authorized administrator].

FPT_STM.1 Reliable time stamps

FPT_STM.1.1 - The TSF shall be able to provide reliable time stamps for its own use.
Application Note: The word “reliable” in the above requirement means that the order of the occurrence of auditable events is preserved. Time stamps include both date and time information that are included in audit records.

FAU_GEN.1 Audit data generation

FAU_GEN.1.1 - The TSF shall be able to generate an audit record of the following auditable events:

a) Start-up and shutdown of the audit functions;

b) All auditable events for the not specified level of audit; and

c) [the events in Table 7. Auditable Events].

FAU_GEN.1.2 - The TSF shall record within each audit record at least the following information:

a) Date and time of the event, type of event, subject identity, and the outcome (success or failure) of the event; and

b) For each audit event type, based on the auditable event definitions of the functional components included in the PP/ST, [information specified in column three of Table 7. Auditable Events].

FAU_SAR.1 Audit review

112 FAU_SAR.1.1 - The TSF shall provide [an authorized administrator] with the capability to read [all audit trail data] from the audit records.

113 FAU_SAR.1.2 - The TSF shall provide the audit records in a manner suitable for the user to interpret the information.

FAU_STG.1 Protected audit trail storage

114 FAU_STG.1.1 - The TSF shall protect the stored audit records from unauthorized deletion.

115 FAU_STG.1.2 - The TSF shall be able to prevent unauthorized modifications to the audit records in the audit trail. ¹

FMT_MOF.1 Management of security functions behavior

116 FMT_MOF.1.1(1) - The TSF shall restrict the ability to enable, disable the functions:

a) [operation of the TOE; and

b) Backup of audit trail data] to [an authorized administrator].

117 Application Note: By “Operation of the TOE” in a) above, we mean having the TOE start up (enable operation) and shut down (disable operation).

FMT_SMF.1 Specification of Management Functions

118 FMT_SMF.1.1 - The TSF shall be capable of performing the following security management functions:

a) [delete and create the security attributes (information flow rules) described in FDP_IFF.1(1-4);

b) override default values for security attributes described in FMT_MSA.3 when an object or information is created;

c) query, modify, delete, and assign the user attributes defined in FIA_ATD.1.1;

d) modify the time and date used to form the timestamps in FPT_STM.1.1;

e) operation of the TOE; and

f) backup of audit trail data].

¹ This wording of this requirement has been modified to reflect Common Criteria International Interpretation #141.
5.1.1.2 SFRs With Strength of Function (SOF) Declarations

The statement of the TOE security requirements must include a minimum strength level for the TOE security functions realized by a probabilistic or permutational mechanism. In the case of this security target, this minimum level shall be SOF-basic.

Specific strength of function metrics are defined for the following requirement:

FIA_UAU.2 - Strength of function shall be demonstrated for the password authentication mechanism to show that it meets SOF-basic, as defined in Part 1 of the CC.

5.2 Security Requirements for the IT Environment

The security functional requirements allocated to the IT Environment consist of the following components from Part 2 of the CC, summarized in Table 8. The SFRs are provided in their entirety in the subsequent paragraphs.

Table 8 Functional Components of the IT Environment

<table>
<thead>

</tbody>
</table>

FPT_RVM.1 Non-Bypassability of the TSP

FPT_RVM.1.1 - The TSF IT Environment shall ensure that TSP enforcement functions are invoked and succeed before each function within the TSC is allowed to proceed.

FPT_SEP.1 TSF Domain Separation

FPT_SEP.1.1 - The TSF IT Environment shall maintain a security domain for its own execution that protects it from interference and tampering by untrusted subjects.

FPT_SEP.1.2 - The TSF IT Environment shall enforce separation between the security domains of subjects in the TSC.

5.3 TOE Security Assurance Requirements

The TOE claims compliance to EAL 2 level of assurance. The security assurance requirements (SARs) for this Security Target include the EAL 2 SARs in Part 3 of the CC. The EAL 2 SARs are identified in the following
Table 9. EAL2 Assurance Components:

5.3.1 Additional Security Assurance Requirements

This section describes one security assurance requirement from the CC Part 3 that the TOE must satisfy in addition to the previously listed EAL2 SARs.

In particular, ALC_FLR.2 for flaw reporting procedures that are designed to help ensure that reported defects in the TOE are addressed by the developer is added. ALC_FLR.2 is not included in any EAL. This additional SAR is restated verbatim from the CC.
5.3.1.1 ALC_FLR.2 Flaw Reporting Procedures

Developer action elements:

ALC_FLR.2.1D – The developer shall provide flaw remediation procedures addressed to TOE developers.

ALC_FLR.2.2D – The developer shall establish a procedure for accepting and acting upon all reports of security flaws and requests for corrections to those flaws.

ALC_FLR.2.3D – The developer shall provide flaw remediation guidance addressed to TOE users.

Content and presentation of evidence elements:

ALC_FLR.2.1C – The flaw remediation procedures documentation shall describe the procedures used to track all reported security flaws in each release of the TOE.

ALC_FLR.2.2C – The flaw remediation procedures shall require that a description of the nature and effect of each security flaw be provided, as well as the status of finding a correction to that flaw.

ALC_FLR.2.3C – The flaw remediation procedures shall require that corrective actions be identified for each of the security flaws.

ALC_FLR.2.4C – The flaw remediation procedures documentation shall describe the methods used to provide flaw information, corrections and guidance on corrective actions to TOE users.

ALC_FLR.2.5C – The flaw remediation procedures shall describe a means by which the developer receives from TOE users reports and enquiries of suspected security flaws in the TOE.

ALC_FLR.2.6C – The procedures for processing reported security flaws shall ensure that any reported flaws are corrected and the correction issued to TOE users.

ALC_FLR.2.7C – The procedures for processing reported security flaws shall provide safeguards that any corrections to these security flaws do not introduce any new flaws.

ALC_FLR.2.8C – The flaw remediation guidance shall describe a means by which TOE users report to the developer any suspected security flaws in the TOE.

Evaluator action elements:
142 ALC_FLR.2.1E – The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.
6 TOE Summary Specification

This section presents a functional overview of the TOE, the security functions implemented by the TOE, and the Assurance Measures applied to ensure their correct implementation.

6.1 TOE Security Functions

The TOE implements the following security functions:

- SECURITY MANAGEMENT
- IDENTIFICATION AND AUTHENTICATION
- USER DATA PROTECTION
  - URL FILTER
  - ANTI-MALWARE
  - CERTIFICATE CHECKING
  - HTTPS SCANNER
- PROTECTION OF SECURITY FUNCTIONS
- AUDIT

TOE security functions are described in the following sections, with references to the particular SFRs that are addressed by those functions.

6.1.1 Security Management [FMT]

The TOE provides a web-based management interface required for an administrator to manage the MWG and utilize its security features. The interface also provides administrators access to audit information.

6.1.1.1 Using Admin Workstation [FMT_1]

Before an administrator may perform any management functions on a MWG they must establish a connection to MWG from a web browser on the administration workstation.

MWG maintains an authorized administrator role. MWG keeps a list which associates particular user identities with the authorized administrator role. When a user attempts to sign in at the GUI, the list is consulted and a user on the list is given the administrative privileges. Only authorized administrators can read system configuration data and examine audit data. (FMT_SMR.1)
6.1.1.2 MWG Administration [FMT_2]
A MWG administrator can manage all other administrative users of the system. Only an authorized administrator is permitted to query, modify, delete or assign individual user attributes such as identity and password. Only an authorized administrator can start up and shut down the operation of the MWG, change the system time and date, and backup the audit trail. (FMT_MTD.1 (1) & (2), FMT_MOF.1, FMT_SMF.1)

6.1.1.3 URL Filter Policy Configuration [FMT_3]
The administrator manages the rules for filtering URL traffic which comprise the URL Policy. Only an authorized administrator is permitted to delete, modify, or add to the filter rules, and to the object definitions that are used in writing policy rules. (FMT_MSA.1, FMT_SMF.1)

6.1.1.4 Anti-Malware Configuration [FMT_4]
The administrator manages the rules for MWG Anti-Malware filtering which comprise the Malware Policy. Only an authorized administrator is permitted to delete, modify, or add to the malware rules, and to the object definitions that are used in writing policy rules. (FMT_MSA.1, FMT_SMF.1)

6.1.1.5 Certificate Checking Configuration [FMT_5]
The administrator manages the rules for certificate checking which comprise the Certificate Policy. Only an authorized administrator is permitted to delete, modify, or add to the certificate checking rules, and to the object definitions that are used in writing policy rules. (FMT_MSA.1, FMT_SMF.1)

6.1.1.6 HTTPS Scanner Configuration [FMT_6]
The administrator manages the rules for performing HTTPS decryption which comprise the HTTPS Policy. Only an authorized administrator is permitted to delete, modify, or add to the HTTPS rules, and to the object definitions that are used in writing policy rules. (FMT_MSA.1, FMT_SMF.1)

6.1.1.7 Initial Configuration [FMT_7]
The default TOE configuration restricts traffic flow. An authorized administrator must override initial information flow security attributes to deactivate URL filtering or Anti-malware filtering in order to allow more data to flow. (FMT_MSA.3, FMT_SMF.1)
6.1.2 Identification and Authentication [FIA]

The MWG management function provides a user interface protected by an identification and authentication mechanism. The TOE requires users to provide unique identification (user IDs) and authentication data (passwords) before any access to the TOE is granted.

6.1.2.1 User Identification [FIA_1]

MWG supports administrative users. The identification information for each MWG administrative user includes the following (FIA_ATD.1):

- The user login name (identity)
- Association of the user with the authorized administrator role
- The password required to login.

MWG requires any potential user to provide identification information before it will allow any security relevant activity on behalf of that user. (FIA_UID.2)

Other individuals or external IT entities that send inter-network communications mediated via MWG are not considered MWG users. They cannot log into MWG and have no direct access to MWG.

6.1.2.2 Authentication [FIA_2]

MWG requires successful password authentication before allowing administrative user access. MWG consults its user policy storage to determine if the provided password matches the user’s valid password. MWG supports reusable passwords with a minimum size of 8 characters. The permutational mechanism as applied in the evaluated configuration meets the standard of SOF-basic. A delay of 5 seconds is introduced following each unsuccessful login attempt. (FIA_UAU.2)

6.1.3 User Data Protection [SW_FDP]

MWG provides URL Filter, Anti-Malware, Certificate Checking and HTTPS Scanning capabilities to examine and filter IP traffic for inappropriate or harmful content. Corresponding policies, or rule sets, are configured to determine what information to watch for and how to react if it is detected. The filters can access various knowledge bases to identify potential threats that might be present in the IP traffic (HTTP, HTTPS and FTP).
6.1.3.1 URL Filter [FDP_1]

On MWG, the flow of HTTP, HTTPS and FTP information through the system is determined by key subject and information security attributes. In particular, the authorized administrator can set up URL filter rules that depend upon the presumed source subject address, the URL requested and the category that can be attributed to the URL. MWG consults its URL trusted source database (that has organized URLs into predefined categories) in order to filter the HTTP traffic according to the rules. (FDP_IFC.1 (1), FDP_IFF.1 (1))

6.1.3.2 Anti-Malware Filter [FDP_2]

Anti-Malware filtering is turned on by an authorized MWG administrator. Following activation, MWG invokes specific Anti-Malware searches to examine the IP traffic to look for malware. When a malware match is identified, MWG performs the configured actions to allow or disallow the traffic flow. (FDP_IFC.1 (2), FDP_IFF.1 (2))

6.1.3.3 Certificate Checker [FDP_3]

Certificate Checking is turned on by an authorized MWG administrator. Following activation, MWG examines the IP traffic to look for a certificate with characteristics such as validity, lifetime, name and chain. MWG then uses that information to determine whether to perform the configured actions to allow or disallow the traffic to flow to the HTTPS Scanner or content filters. (FDP_IFC.1 (3), FDP_IFF.1 (3))

6.1.3.4 HTTPS Scanner [FDP_4]

Upon activation by an authorized administrator, MWG will decrypt HTTPS traffic prior to forwarding the clear-text content to the MWG URL and Anti-Malware filter functions. Such messages, if they pass the filters, will be re-encrypted prior to being forwarded to their intended destinations. MWG uses OpenSSL FIPS Object Module Version 1.1.2 (FIPS 140-2 certificate 918) for HTTPS encryption and decryption. (FDP_IFC.1 (4), FDP_IFF.1 (4), FCS_COP.1 (1), FCS_COP.1 (2), FCS_CKM.1 (1), FCS_CKM.2 (2), FCS_CKM.4)

6.1.4 Protection of Security Functions [FPT]

The TOE provides an accurate time source which is needed to ensure that the sequence of reported security actions and security decisions is correct.
6.1.4.1 Time Stamps [FPT_1]

The hardware platform, part of the IT environment, includes a battery-backed real time clock (RTC) which maintains the time when the platform is shut down.

The software, with its McAfee Linux OS features, reads the RTC (or its representation in VMware) at bootup and maintains its own time stamp throughout operation. The software provides the reliable time stamp to any processes that request the time. Also, the software manages any changes to the time and determines the access requirements for users or processes desiring to modify the time. Once the software has changed the time, it updates the RTC. The software provides the time stamp during TOE operation, while the RTC maintains the time when the platform is shut down. (FPT_STM.1)

6.1.5 Audit [FAU]

The TOE generates two different types of audit records. System audit records cover activities related to the administration and management of the TOE, while traffic audit records provide a log of information flowing through the MWG’s filtering operations. The TOE collects both the system audit and traffic log information into a data store, which is part of the TOE. MWG records attempts to access the system itself, such as successful and failed authentication, as well as the actions taken by the user once authenticated. Auditable actions include addition or deletion of administrators, changes to the filtering rules and decisions made by the filtering functions. Authorized users are allowed to review audit data.

6.1.5.1 Logging [FAU_1]

MWG provides information to identify the type of auditable event and entities related to the event as described in Table 7. Auditable Events. The information includes both success and failure outcomes for the auditable events. MWG augments that audit event with a time stamp. (FAU_GEN.1)

MWG accumulates the audit and access events into log files. The authorized administrator may remove audit data to manage the storage space, but nobody is allowed to modify the content of the audit files. The format of new entries to the access logs can be modified. (FAU_STG.1)

MWG audit is separated into an “audit log” which covers administrative activities and an “access log” which covers communication requests and the result (traffic passes or not).
6.1.5.2 Audit Reporting [FAU_2]

The MWG management application allows an authorized administrator to review and interpret the audit data using a browser on an administration workstation. The selected audit records are sorted in time sequence order and are displayed in a readable format. (FAU_SAR.1)

6.1.5.3 Audit Data Protection [FAU_3]

MWG provides mechanisms which allow an authorized administrator to manage the audit storage to minimize the risk of losing data. The authorized administrator can cause MWG to automatically rotate, delete and push audit data off box to ensure adequate space for new records while making existing records available for review. Unauthorized users can not delete audit data from the system. (FAU_STG.1)

6.2 Assurance Measures

This section identifies the Configuration Management, Delivery/Operation, Development, Guidance Documents, Life-cycle Support, Test, and Vulnerability Assessment measures applied by McAfee to satisfy CC assurance requirements.

The security assurance requirements for this Security Target include the requirements taken from Part 3 of the CC, augmented by, ALC_FLR.2. These assurance components are described in Section 5.3.

6.2.1 Configuration Management

The Configuration Management measures applied by McAfee include unique identification for configuration items, proper labeling, tracking of configuration items and tracking of security flaws. These configuration management measures are documented within the following McAfee documents:

- MWG Configuration Management Plan

Assurance Requirements Satisfied: ACM_CAP.2

6.2.2 Delivery and Operation

McAfee provides measures to ensure that the TOE is delivered without modification and that it is installed, generated, and started in a way that will lead to the evaluated configuration. These delivery and operation measures are documented within the following McAfee documents:

- MWG Delivery Procedure
- MWG Installation and Configuration Guide
- Common Criteria Evaluated Configuration Guide (CCECG)
**Assurance Requirements Satisfied:** ADO_DEL.1 and ADO_IGS.1

### 6.2.3 Development

McAfee provides increasingly refined descriptions of the TOE security functionality starting with this Security Target. Design documentation consists of a functional specification and a high level design. In addition, there is a representation correspondence that maps the various representations of the TOE to one another and to this Security Target. This information is provided by the following McAfee documents:

- MWG Security Target
- MWG Functional Specification
- MWG High-Level Design
- MWG Security Functions Correspondence Analysis

**Assurance Requirements Satisfied:** ADV_FSP.1, ADV_HLD.1, and ADV_RCR.1.

### 6.2.4 Guidance

McAfee provides administrator guidance to be used by those persons responsible for configuring, maintaining, and administering the TOE in a correct manner for maximum security. The guidance includes warnings about functions and privileges that should be controlled in a secure processing environment. These guidance measures are documented within the following McAfee documents:

- MWG Administration Guide
- Common Criteria Evaluated Configuration Guide (CCECG)\(^2\)

**Assurance Requirements Satisfied:** AGD_ADM.1 and AGD_USR.1

### 6.2.5 Life-cycle Support

McAfee provides information describing internal and user procedures to handle reports of TOE security flaws. This information is documented within the following McAfee documents:

- MWG Security Flaw Reporting Procedures\(^3\)
- Common Criteria Evaluated Configuration Guide (CCECG)\(^4\)

**Assurance Requirements Satisfied:** ALC_FLR.2

---

\(^2\) The CCECG provides administrative guidance for running Web Gateway in the configuration that was evaluated for Common Criteria.

\(^3\) These are the internal developer procedures for fixing any flaws that might be reported.

\(^4\) A section of this document provides the user guidance for reporting flaws.
6.2.6 Test

McAfee performs extensive testing of MWG to ensure that it behaves as specified in the design documentation and in accordance with the security functional requirements specified in the ST. Test coverage analysis is performed to confirm that the testing is sufficiently extensive. These tests and analyses are presented in the following McAfee documents:

- MWG Test Plan/Coverage Analysis
- MWG Test Procedures and Results

**Assurance Requirements Satisfied**: ATE_COV.1, ATE_FUN.1, and ATE_IND.2

6.2.7 Vulnerability Assessment

In addition to the design and testing process, McAfee performs vulnerability assessment of the TOE. Strength of function analysis is performed on the administrator authentication mechanism in order to gain more confidence in the overall security functionality of the TOE. Finally, a systematic analysis of the TOE deliverables is performed to identify any flaws or weaknesses that could be exploited by an attack. These vulnerability assessment activities are documented within the following McAfee documents:

- MWG Strength of Function Analysis
- MWG Vulnerability Analysis

**Assurance Requirements Satisfied**: AVA_SOF.1, and AVA_VLA.1
7 PP Claims

184 The ST does not claim conformance with any PP.
8 Rationale

8.1 Rationale for TOE Security Objectives

185 O.IDAUTH  This security objective is necessary to counter the threat:
T.NOAUTH because it requires that users be uniquely identified before
accessing the TOE.

186 O.MEDIAT  This security objective is necessary to counter the threat:
T.MEDIAT that has to do with getting impermissible information to
flow through the TOE. This security objective requires that all
information that passes through the networks is mediated by the TOE.

187 O.SECSTA  This security objective ensures that no information is
compromised by the TOE upon start-up or recovery and thus counters
the threats: T.NOAUTH and T.SELPRO.

188 O.SELPRO  This security objective is necessary to counter the threats:
T.SELPRO, T.NOAUTH, and T.AUDFUL because it requires that the
TOE protect itself from attempts to bypass, deactivate, or tamper with
TOE security functions. In particular, it counters attempts from an
attacker to bypass the TSF to gain access to the TOE or the assets it
protects. It also counters attempts to exhaust the audit trail and thereby
bypass the audit security function.

189 O.AUDREC This security objective is necessary to counter the threat:
T.AUDACC by requiring a readable audit trail and a means to search the
information contained in the audit trail.

190 O.ACCOUN This security objective is necessary to counter the threat:
T.AUDACC because it requires that users are accountable for
information flows through the TOE and that authorized administrators
are accountable for the use of security functions related to audit.

191 O.SECFUN  This security objective is necessary to counter the threats:
T.NOAUTH and T.AUDFUL by requiring that the TOE provide
functionality that ensures that only the authorized administrator has
access to the TOE security functions.

8.2 Rationale for the TOE Operating Environment Security Objectives

192 OE.PHYSEC The TOE is physically secure. This objective is needed to ensure that unauthorized individuals have no physical access to the computing platform running the TOE software. This precludes such individuals from performing such activities as restarting the system or loading software that changes the security function operations.

193 OE.PUBLIC The TOE does not host public data. This objective helps ensure that the computing platform is dedicated to the TOE software and related data, thus precluding any possible adverse effects of foreign data.

194 OE.NOEVIL Authorized administrators are non-hostile and follow all administrator guidance; however, they are capable of error. This objective ensures that the administrators are trusted, competent and take no malicious actions.

195 OE.SINGEN Information cannot flow among the internal and external networks unless it passes through the TOE. This objective ensures that the filtering function of the TOE cannot be bypassed as traffic flows between the networks.

196 OE.GUIDAN This non-IT security objective is necessary to counter the threat: TE.TUSAGE and T.AUDACC because it requires that those responsible for the TOE ensure that it is delivered, installed, administered, and operated in a secure manner.
OE.ADMTRA This non-IT security objective is necessary to counter the threat: TE.TUSAGE and T.AUDACC because it ensures that authorized administrators receive the proper training.

OE.PROLIN The communication path between the TOE and the local administration workstation (browser) is physically protected. This objective ensures that a non-authorized user can not gain access to the TOE by connecting a rogue IT device to this communication line.

OE.NOREMO Human users who are not authorized administrators can not directly or remotely access the local administration platform. This objective ensures that unauthorized users have neither local nor remote access to the TOE via the administration platform.

OE.BENIGN The Windows OS running on the local administration platform will provide necessary computing services, but will not tamper with browser communications to the TOE. This objective ensures that OS does not contain inappropriate features or vulnerabilities that might adversely affect browser communications with the TOE and thereby change the TOE security policy enforcement.

</table>

The remaining security objectives for the environment are, in part, a re-statement of the security assumptions. Each of these security objectives traces to the corresponding assumption with a similar name. Objective OE.PHYSEC traces to assumption A.PHYSEC, for example.

8.3 Rationale for TOE Security Requirements

The functional and assurance requirements presented in this ST are mutually supportive and their combination meet the stated security objectives. The security requirements were derived according to the general model presented in Part 1 of the Common Criteria. Table 13. Mapping SFRs to TOE Security Objectives illustrates the mapping between the TOE security requirements and the TOE security objectives. Table 11. Mapping Threats to TOE Security Objectives demonstrates the relationship between the TOE threats and the TOE security objectives. Together these tables demonstrate the completeness and sufficiency of the requirements.

The rationale for the SOF is based on the low attack potential identified in this ST, augmented by the need to protect against more than casual attempted breaches of security. SOF-basic is therefore selected. The
security objectives imply the need for probabilistic or permutational security mechanisms.

**FMT_SMR.1 Security roles**

Each of the CC class FMT components in this ST depend on this component. It requires the ST writer to choose a role(s). This component traces back to and aids in meeting the following objective: O.SECFUN.

**FIA_ATD.1 User attribute definition**

This component exists to provide users with attributes to distinguish one user from another, for accountability purposes and to associate the role chosen in FMT_SMR.1 with a user. This component traces back to and aids in meeting the following objectives: O.IDAUTH and O.SECFUN.

**FIA_UID.2 User identification before any action**

This component ensures that before anything occurs on behalf of a user, the user’s identity is available to the TOE. This component traces back to and aids in meeting the following objectives: O.IDAUTH and O.ACCOUN.

**FIA_UAU.2 User authentication before any action**

This component was chosen to ensure that authentication mechanisms are used appropriately in all attempts to access the TOE. An additional SOF metric for this requirement is defined to ensure that the mechanisms are of adequate probabilistic strength to protect against authentication data compromise. This component traces back to and aids in meeting the following objective: O.IDAUTH.

**FDP_IFC.1 Subset information flow control (1) – (4)**

This component identifies the entities involved in the URL, MALWARE, Certificate and HTTPS SFPs (IP information flowing between networks). This component traces back to and aids in meeting the following objective: O.MEDIAT.

**FDP_IFF.1 Simple security attributes (1) – (4)**

This component identifies the attributes of the users sending information, as well as the attributes for the information itself. Each information flow policy is defined by saying under what conditions information is permitted to flow. This component traces back to and aids in meeting the following objective: O.MEDIAT.

**FCS_COP.1 Cryptographic operation (1) – (2)**

These components provide symmetric and asymmetric encryption and decryption services to support the mediation of HTTPS traffic. These components trace back to and aid in meeting the following objective: O.MEDIAT.
FCS_CKM.1 Cryptographic key generation (1) – (2)
These components provide symmetric and asymmetric key generation services to support the mediation of HTTPS traffic. These components trace back to and aid in meeting the following objective: O.MEDIAT.

FCS_CKM.4 Cryptographic key destruction
This component provides key destruction services to support the mediation of HTTPS traffic. This component traces back to and aid in meeting the following objective: O.MEDIAT.

FMT_MSA.1 Management of security attributes
This component ensures the TSF enforces the four information flow security function policies to restrict the ability to add, delete, and modify within a rule those security attributes that are listed in section FDP_IFF.1 (1) - (4). This component traces back to and aids in meeting the following objectives: O.MEDIAT, O.SECSTA, and O.SECFUN.

FMT_MSA.3 Static attribute initialization
This component ensures that there is a predictable, restrictive, policy for the information flow control security rules. This component traces back to and aids in meeting the following objectives: O.MEDIAT and O.SECSTA.

FMT_MTD.1 Management of TSF data (1)
This component ensures that the TSF restrict abilities to query, modify, delete and assign certain user attributes as defined in FIA_ATD.1.1 to only the authorized administrator. This component traces back to and aids in meeting the following objective: O.SECFUN.

FMT_MTD.1 Management of TSF data (2)
This component ensures that the TSF restrict abilities to modify the time and date used to form timestamps to only the authorized administrator. This component traces back to and aids in meeting the following objective: O.SECFUN.

FPT_STM.1 Reliable time stamps
FAU_GEN.1 depends on this component. It ensures that the date and time on the TOE is dependable. This is important for the audit trail. This component traces back to and aids in meeting the following objective: O.AUDREC.

FAU_GEN.1 Audit data generation
This component outlines what data must be included in audit records and what events must be audited. This component traces back to and aids in meeting the following objectives: O.AUDREC and O.ACCOUN.
FAU_SAR.1  Audit review  
219 This component ensures that the audit trail is understandable. This component traces back to and aids in meeting the following objective: O.AUDREC.

FAU_STG.1  Protected audit trail storage  
220 This component is chosen to ensure that the audit trail is protected from tampering, the security functionality is limited to the authorized administrator, and that start-up and recovery does not compromise the audit records. This component traces back to and aids in meeting the following objectives: O.SELPRO, O.SECSTA and O.SECFUN.

FMT_MOF.1  Management of security functions behavior (1)  
221 This component was to ensure the TSF restricts the ability to modify the behavior of functions such as audit trail management to an authorized administrator. This component traces back to and aids in meeting the following objectives: O.SECSTA and O.SECFUN.

FMT_SMF.1  Specification of Management Functions  
222 This component is a necessary prerequisite for and supports the following SFRs that have been rationalized above: FMT_MSA.1, FMT_MSA.3, FMT_MTD.1 (1), FMT_MTD.1(2) and FMT_MOF.1. This component addresses the same security objectives.

Table 13. Mapping SFRs to TOE Security Objectives

|                  | O | I | D | A | U | T | H | O | M | E | D | I | A | T | O | S | E | C | S | A | T | O | S | E | L | P | R | O | U | N |

| FIA_AFL.1        |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| FIA_UAU.2        | X |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| FDP_IFC.1 (1)    | X |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| FDP_IFC.1 (2)    | X |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| FDP_IFC.1 (3)    | X |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
### 8.4 Rationale for TOE IT Environment Security Requirements

**FPT_RVM.1** Non-bypassability of the TSP

This component ensures that the TOE security policy enforcement functions can not be bypassed when data flows between the internal and external networks under its control. This component traces back to and aids in meeting the following objective: OE.SINGEN.

**FPT_SEP.1** TSF Domain Separation
This component ensures that untrusted subjects cannot interfere with or tamper with the operation of the TSF. This component traces back to and aids in meeting the following objectives: OE.GUIDAN.

8.5 Rationale for Assurance Requirements

The EAL 2 level of assurance is consistent with best commercial practice for IT development and provides a product that is competitive against non-evaluated products with respect to functionality, performance, cost, and time-to-market. The TOE assurance also meets current constraints on widespread acceptance, by expressing its claims against EAL2. Augmentation with ALC_FLR.2 provides customers with added confidence that any reported security flaws in the TOE will be addressed.

8.6 SOF Rationale

The rationale for the chosen level of SOF-basic is related to the intended TOE environment. The low attack potential described in the TOE assumptions and the attack potential of the identified threat agents requires at least SOF-basic. The security objectives for the TOE imply probabilistic or permutational security mechanisms. The metrics defined are the minimal “industry” standard accepted for passwords.

8.7 Dependency Rationale

The following table is provided as evidence that all dependencies have been satisfied in this ST.

<table>
<thead>
<tr>

</table>
### 8.8 Internal Consistency and Mutually Supportive Rationale

The set of security requirements identified in this ST for MWG form a mutually supportive and internally consistent whole as evidenced by the following:

a) The choice of security requirements is justified as shown in Sections 8.3, 8.4, and 8.5. The choice of SFRs and SARs was made based on the assumptions and threats identified in Section 3 and the objectives identified in Section 4. Sections 8.1 and 8.2 of this ST provide evidence the security objectives counter threats to the TOE. Also, Section 8.2 demonstrates that the assumptions and objectives counter threats to the TOE operating environment.

d) The security functionality as described in the TOE Summary Specification satisfies the SFRs. All SFR dependencies have been met as shown in Section 8.7, Table 14.

e) The SOF claims are valid. The chosen SOF-basic level meets the attack potential identified in Section 3 of this ST. The identified metrics and SOF claim are commensurate with the EAL 2 level of assurance.

f) The SARs are appropriate for the assurance level of EAL 2 and are satisfied by MWG as demonstrated in Section 6.2 of this ST.

### 8.9 Rationale for Explicit Requirements

There are no explicit requirements.

### 8.10 Rationale for TOE Summary Specification

This section demonstrates that the TOE security functions and assurance measures are suitable to meet the TOE security requirements.
8.10.1 TOE Security Requirements

The specified TOE security functions work together to satisfy the TOE security functional requirements. Section 6.1 includes in the descriptions of security functions a mapping to SFRs to show that each security function is traced to at least one SFR. Table 15. Mapping of SFRs to Security Functions demonstrates that each SFR is covered by at least one security function.

<td>FCS_CKM.1 (2)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>FCS_CKM.4</td>
<td></td>
</tr>
<tr>
<td>FPT</td>
<td>FPT_STM.1</td>
<td>The FPT security function provides a reliable time stamp that is essential for TOE security audits. The reliable time stamp provides critical information for monitoring user activities and for detecting real, potential or imminent violations of the TOE’s security policy.</td>
</tr>
<tr>
<td>FAU</td>
<td>FAU_GEN.1</td>
<td>The FAU security function generates audit records related to security relevant events. It provides the capability to review audit logs. Audit records are protected from modification and unauthorized deletion.</td>
</tr>
<tr>
<td></td>
<td>FAU_SAR.1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>FAU_STG.1</td>
<td></td>
</tr>
</tbody>
</table>

233 Because the security functions trace to SFRs, which were shown to be mutually supportive in Section 8.8, and Table 16 justifies that the
security functions implement all the SFRs, it is concluded that the
security functions work together to satisfy the SFRs.

8.10.2 TOE Assurance Requirements

Table 17 is provided to demonstrate that each TOE SAR is adequately
addressed by at least one assurance measure.
