Part 2. The requirements of CEM

Part 3. Present state

**Part 4. Adoption FEMA** 

Independent testing (ATE\_IND)

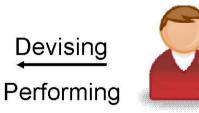

The objectives of this family are built upon the assurances achieved in the ATE\_FUN, ATE\_COV, and ATE\_DPT families by verifying the developer testing and performing additional tests by the evaluator.

Verifying

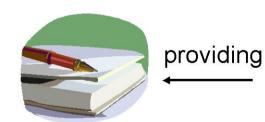

- From CC Version 3.1

Results of additional tests

Evaluator

Test documentation

Developer

1.2 Vulnerability Part 1. Introduction

Vulnerability
 A weakness in the TOE that can be used to violate the SFRs in some environment.
 From CC Version 3.1

Vulnerability Analysis
An assessment to determine whether potential vulnerabilities identified, during the evaluation of the development and anticipated operation of the TOE or by other methods (e.g. by flaw hypotheses or quantitative or statistical analysis of the security behaviour of the underlying security mechanisms), could allow attackers to violate the SFRs.

- From CC Version 3.1

### Part 1. Introduction

## Part 2. The requirements of CEM

- 2.1 The requirements of independent testing
- 2.2 The requirements of vulnerability analysis

Part 3. Present state

Part 4. Adoption FEMA

ATE\_IND.2-6 The evaluator *shall devise* a test subset.

ATE\_IND.2-7 The evaluator *shall produce* test documentation for the test subset that is sufficiently detailed to enable the tests to be reproducible.

The evaluator *shall conduct* testing.

AVA\_VAN.3-4 The evaluator *shall conduct* a focused search of ST, guidance documentation, functional specification, TOE design, security architecture description and implementation representation to identify possible potential vulnerabilities in the TOE.

## Annex B. Vulnerability Assessment (AVA)

#### **B.2.2 Identification of Potential Vulnerabilities**

#### B.2.2.2.3 Methodical

The methodical analysis approach takes the form of a **structured examination of the evidence**.

#### Part 1. Introduction

## Part 2. The requirements of CEM

### Part 3. Present state and Problems

- 3.1 Present state
- 3.2 Problems

**Part 4. Adoption FEMA** 

## Independent testing

- An evaluator should perform additional testing referred evaluation evidences
- Evaluation evidences : ST, DEL, ATE etc.
- Test Case generation in accordance with an evaluator's experience or knowledge

## Vulnerability Analysis procedure

- 1) Listing Vulnerabilities
- Known vulnerability lists: Investigated from CVE, Websites of Device development companies and papers

|                                       | Site  | URL  |
|---------------------------------------|---|--|
| Known vulnerability                   | CERT  | http://www.cert.org/nav/index_red.html   |
|                                       | ICAT  | http://nvd.nist.gov/   |
|                                       | CVE   | http://www.cve.mitre.org/cve/  |
| Security Configuration<br>Check lists | figuration NIST http://csrc.nist.gov/checklists/repository/catego |  |
| Security recommendation of            | SUN   | http://sunsolve.sun.com/pub-<br>cgi/show.pl?target=home                        |
| device development company            | MS  | http://www.microsoft.com/security/default.mspx                                 |
| Company                               | CISCO   | http://www.cisco.com/en/US/products/products_se curity_advisories_listing.html |

Vulnerability Analysis procedure (Cont'd)

- Listing Vulnerabilities derived from pre-evaluated product
  - . Referred from evaluation reports
- -Listing Vulnerabilities during evaluation
- . Analyzing whether **V**ulnerability possibility exists in development evaluation reports
- . Performing Vulnerability analysis by recording anticipated vulnerability points in document analysis and functional testing
- 2) Vulnerability analysis (penetration testing) planning
- 3) Vulnerability testing
- 4) Reporting the results of Vulnerability analysis

Consistency absence between evaluators
 Insufficiency in a guidelines for vulnerability evaluation
 Absence of vulnerability evaluation method

Solution

Introduce a structured examination of the evidence recommended in CEM

→ Adopting FMEA which is enable to make a formal analysis method

#### Part 1. Introduction

Part 2. The requirements of CEM

Part 3. Present state and Problems

Part 4. Adopting FEMA to CC

- 4.1 Overview of FEMA
- 4.2 Examples

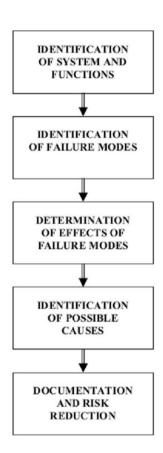

#### FMEA (Failure Mode and Effect Analysis)

a systematic way of identifying failure modes of a system, item or function, and evaluating the effects of the failure modes on the higher level.

Failure causes are any errors or defects in process, design, or item especially ones that affect the customer, and can be potential or actual. Effects analysis refers to studying the consequences of those failures

|          | Example FMEA Worksheet                    |  |                           |   |                             |  |                            |                                  |                                  |   |  |                 |

sensor

#### Software FMEA

For software-based systems, the failure modes of software are generally unknown. The software modules do not fail, they only display incorrect behaviour. To find out this incorrect behaviour the safety engineer has to apply his own knowledge about the software to set up an appropriate FMEA approach.

#### **Example of SW-FMEA**

| Ref-No | Component | Fault | Cause | Failure effect |
|--------|-----------|-------|-------|----------------|
|        |           |       |       |                |
|        |           |       |       |                |
|        |           |       |       |                |
|        |           |       |       |                |
|        |           |       |       |                |
|        |           |       |       |                |
|        |           |       |       |                |
|        |           |       |       |                |

## Software FMEA for Independent testing

| Ref-No | TSF | Fault | Cause | Failure effect | Test case |
|--------|-----|-------|-------|----------------|-----------|
|        |     |       |       |                |           |
|        |     |       |       |                |           |
|        |     |       |       |                |           |
|        |     |       |       |                |           |
|        |     |       |       |                |           |

- TSF: Name of TOE Security Function considered
- Fault: Potential faults that the TSF would have
- Cause: any error or defect arising problems in TSF
- Failure effect : consequences of those failures
- Test case: test methods which need to validate the TSF

#### Software FMEA for Vulnerability Analysis

| Ref-No | Subsystem | vulnerability | Cause | vulnerability effect | Test case |
|--------|-----------|---------------|-------|----------------------|-----------|
|        |           |               |       |                      |           |
|        |           |               |       |                      |           |
|        |           |               |       |                      |           |
|        |           |               |       |                      |           |
|        |           |               |       |                      |           |

- Subsystem: Individual sub-system that consist of TOE
- Vulnerability: Potential Vulnerability in the subsystem
- Cause : factors arising vulnerabilities
- Vulnerability effect : consequences of those vulnerabilities
- Test case: test methods which need to validate the vulnerabilities

#### 5. Conclusion

#### Advantage of FEMA

Performing independence testing and vulnerability analysis by the structured method using FMEA

Improvement inconsistency between evaluators

Enable to make DB if using FMEA tool

#### Disadvantage of FEMA

Cost for performing FMEA (time, human resource)

Needed sufficient communication between an evaluator and a developer

# Q&A

Thanks for your attention.
