Common Criteria Recognition Arrangement

Common Criteria

The IT product identified in this certificate has been evaluated at an accredited and licensed / approved evaluation facility using the Common Methodology for IT Security Evaluation, Version 2.3 for conformance to the Common Criteria for IT Security Evaluation (CC), Version 2.3 (ISO/IEC 15408:2005).

This certificate applies only to the specific version and release of the product in its evaluated configuration and in conjunction with the complete Certification Report.

The evaluation has been conducted in accordance with the provisions of the certification scheme of the German Federal Office for Information Security (BSI) and the conclusions of the evaluation facility in the evaluation technical report are consistent with the evidence adduced.

This certificate is not an endorsement of the IT product by the Federal Office for Information Security or any other organisation that recognises or gives effect to this certificate, and no warranty of the IT product by the Federal Office for Information Security or any other organisation that recognises or gives effect to this certificate, is either expressed or implied.

Bonn, 08 July 2008 For the Federal Office for Information Security

SOGIS - MRA

This page is intentionally left blank.

## **Preliminary Remarks**

Under the BSIG<sup>1</sup> Act, the Federal Office for Information Security (BSI) has the task of issuing certificates for information technology products.

Certification of a product is carried out on the instigation of the vendor or a distributor, hereinafter called the sponsor.

A part of the procedure is the technical examination (evaluation) of the product according to the security criteria published by the BSI or generally recognised security criteria.

The evaluation is normally carried out by an evaluation facility recognised by the BSI or by BSI itself.

The result of the certification procedure is the present Certification Report. This report contains among others the certificate (summarised assessment) and the detailed Certification Results.

The Certification Results contain the technical description of the security functionality of the certified product, the details of the evaluation (strength and weaknesses) and instructions for the user.

<sup>&</sup>lt;sup>1</sup> Act setting up the Federal Office for Information Security (BSI-Errichtungsgesetz, BSIG) of 17 December 1990, Bundesgesetzblatt I p. 2834

## A Certification

## **1** Specifications of the Certification Procedure

The certification body conducts the procedure according to the criteria laid down in the following:

- BSIG<sup>2</sup>
- BSI Certification Ordinance<sup>3</sup>
- BSI Schedule of Costs<sup>4</sup>
- Special decrees issued by the Bundesministerium des Innern (Federal Ministry of the Interior)
- DIN EN 45011 standard
- BSI certification: Procedural Description (BSI 7125) [4]
- Common Criteria for IT Security Evaluation (CC), Version 2.3 (ISO/IEC 15408:2005)<sup>5</sup>
- Common Methodology for IT Security Evaluation, Version 2.3
- BSI certification: Application Notes and Interpretation of the Scheme (AIS)
- Advice from the Certification Body on methodology for assurance components above EAL4 (AIS 34)

## 2 Recognition Agreements

In order to avoid multiple certification of the same product in different countries a mutual recognition of IT security certificates - as far as such certificates are based on ITSEC or CC - under certain conditions was agreed.

<sup>&</sup>lt;sup>2</sup> Act setting up the Federal Office for Information Security (BSI-Errichtungsgesetz, BSIG) of 17 December 1990, Bundesgesetzblatt I p. 2834

<sup>&</sup>lt;sup>3</sup> Ordinance on the Procedure for Issuance of a Certificate by the Federal Office for Information Security (BSI-Zertifizierungsverordnung, BSIZertV) of 07 July 1992, Bundesgesetzblatt I p. 1230

<sup>&</sup>lt;sup>4</sup> Schedule of Cost for Official Procedures of the Bundesamt für Sicherheit in der Informationstechnik (BSI-Kostenverordnung, BSI-KostV) of 03 March 2005, Bundesgesetzblatt I p. 519

<sup>&</sup>lt;sup>5</sup> Proclamation of the Bundesministerium des Innern of 10 May 2006 in the Bundesanzeiger dated 19 May 2006, p. 3730

### 2.1 European Recognition of ITSEC/CC - Certificates

The SOGIS-Mutual Recognition Agreement (MRA) for certificates based on ITSEC became effective on 3 March 1998.

This agreement was signed by the national bodies of Finland, France, Germany, Greece, Italy, The Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom. This agreement on the mutual recognition of IT security certificates was extended to include certificates based on the CC for all Evaluation Assurance Levels (EAL 1 - EAL 7). The German Federal Office for Information Security (BSI) recognises certificates issued by the national certification bodies of France and the United Kingdom within the terms of this agreement.

The SOGIS-MRA logo printed on the certificate indicates that it is recognised under the terms of this agreement.

#### 2.2 International Recognition of CC - Certificates

An arrangement (Common Criteria Recognition Arrangement) on the mutual recognition of certificates based on the CC Evaluation Assurance Levels up to and including EAL 4 has been signed in May 2000 (CCRA). It includes also the recognition of Protection Profiles based on the CC.

As of February 2007 the arrangement has been signed by the national bodies of: Australia, Austria, Canada, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, India, Israel, Italy, Japan, Republic of Korea, The Netherlands, New Zealand, Norway, Republic of Singapore, Spain, Sweden, Turkey, United Kingdom, United States of America. The current list of signatory nations resp. approved certification schemes can be seen on the web site: http://www.commoncriteriaportal.org

The Common Criteria Recognition Arrangement logo printed on the certificate indicates that this certification is recognised under the terms of this agreement.

## **3** Performance of Evaluation and Certification

The certification body monitors each individual evaluation to ensure a uniform procedure, a uniform interpretation of the criteria and uniform ratings.

The product VoiceIdent Unit 2.0 has undergone the certification procedure at BSI. This is a re-certification based on BSI-DSZ-CC-0359-2007. Specific results from the evaluation process BSI-DSZ-CC-0359-2007 were re-used.

The evaluation of the product VoiceIdent Unit 2.0 was conducted by SRC Security Research & Consulting GmbH. The evaluation was completed on 23 June 2008. The SRC Security Research & Consulting GmbH is an evaluation facility (ITSEF)<sup>6</sup> recognised by the certification body of BSI.

For this certification procedure the sponsor and applicant is: Deutsche Telekom AG

The product was developed by: Deutsche Telekom AG

The certification is concluded with the comparability check and the production of this Certification Report. This work was completed by the BSI.

<sup>&</sup>lt;sup>6</sup> Information Technology Security Evaluation Facility

## 4 Validity of the certification result

This Certification Report only applies to the version of the product as indicated. The confirmed assurance package is only valid on the condition that

- all stipulations regarding generation, configuration and operation, as given in the following report, are observed,
- the product is operated in the environment described, where specified in the following report and in the Security Target.

For the meaning of the assurance levels and the confirmed strength of functions, please refer to the excerpts from the criteria at the end of the Certification Report.

The Certificate issued confirms the assurance of the product claimed in the Security Target at the date of certification. As attack methods may evolve over time, the resistance of the certified version of the product against new attack methods can be re-assessed if required and the sponsor applies for the certified product being monitored within the assurance continuity program of the BSI Certification Scheme. It is recommended to perform a re-assessment on a regular basis.

In case of changes to the certified version of the product, the validity can be extended to the new versions and releases, provided the sponsor applies for assurance continuity (i.e. re-certification or maintenance) of the modified product, in accordance with the procedural requirements, and the evaluation does not reveal any security deficiencies.

## 5 Publication

The product VoiceIdent Unit 2.0 has been included in the BSI list of the certified products, which is published regularly (see also Internet: http:// <u>www.bsi.bund.de</u>) and [6]. Further information can be obtained from BSI-Infoline +49 228 9582-111.

Further copies of this Certification Report can be requested from the developer<sup>7</sup> of the product. The Certification Report may also be obtained in electronic form at the internet address stated above.

<sup>&</sup>lt;sup>7</sup> Deutsche Telekom AG Friedrich-Ebert-Allee 140 53113 Bonn

## **B** Certification Results

The following results represent a summary of

- the Security Target of the sponsor for the Target of Evaluation,
- the relevant evaluation results from the evaluation facility, and
- complementary notes and stipulations of the certification body.

## **1** Executive Summary

The Target of Evaluation (TOE) is the product VoiceIdent Unit 2.0. The TOE consists of the Voice Gateway/Sikom (Sikom VoiceMan 7.5), the ASR/Verifier (Nuance ASR 9.0 / Verifier 3.5), the Application Server (Jakarta Tomcat 5.5, SV-VoiceDialog Version 2.0, SV-Webservice Version 2.0) and the Admin Server (SV-AdminSrv Version 2.0).

VoiceIdent Unit 2.0 provides a verification process to verify the claimed identity of a human being using his voice as a unique characteristic of his body. It enables operators of portals to uniquely authenticate their customers by means of a voiceprint. A portal in relation to the TOE is the physical or logical point beyond which information or assets are protected by the TOE. With failed verification, the portal is closed for the user. Via successful verification, the portal is open.

The TOE is a biometric system that works in verification mode. Biometric Identification is not addressed within the evaluation. Furthermore the enrolment process is out of scope of the evaluation and it is assumed that all authorized users have been properly enrolled. VoiceIdent Unit 2.0 verifies the identity of a user for the purpose of controlling access to the portal.

Beside the biometric verification process VoiceIdent Unit 2.0 includes a username/password mechanism to identify and authenticate an administrator of the system and enforces an access control for the objects of the TOE. This is especially important to limit the ability to change the threshold settings for the biometric verification process to an authorized administrator.

As the evaluation work performed for this certification procedure was carried out as a reevaluation based on the certificate BSI-DSZ-CC-0359-2007, re-use of specific evaluation tasks was possible. The focus of this re-evaluation was on the extension to the VoIPtechnology besides normal telephony (i.e. extension of capture devices to VoIP-devices besides normal telephones in the IT environment of the TOE and update of the Voice Gateway in the TOE), the adding of the database types IBM DB2 and the Microsoft SQLServer besides the Oracle 9.2 DBMS (databases are IT environment of the TOE) and update of the automatic speech recognition software Nuance ASR 9.0 to the latest version.

The Security Target [7] is the basis for this certification. It is based on the certified Protection Profile Protection Profile - Biometric Verification Mechanisms, Version 1.04 BSI-PP-0016-2005 [10].

The TOE Security Assurance Requirements (SAR) are based entirely on the assurance components defined in Part 3 of the Common Criteria (see part C or [1], part 3 for details). The TOE meets the Assurance Requirements of the Evaluation Assurance Level EAL 2 augmented by ADV\_SPM.1.

The TOE Security Functional Requirements (SFR) relevant for the TOE are outlined in the Security Target [7], chapter 5.1. They are all selected from Common Criteria Part 2. Thus the TOE is CC Part 2 conformant.

The Security Requirements relevant for the Environment of the TOE are outlined in the Security Target [7], chapter 5.2.

TOE Security Function	Addressed issue
F.AUDIT_REACTION	Logging of security critical processes
F.ROLES_AND_ACCESS	Role based access control
F.BIO_VERIFICATION	Access control to a portal by biometric verification mechanism
F.AUTHADMIN	TOE administrator authentication
F.RESIDUAL	No residual data remaining
F.NO_REPRODUCE_OR_ RESIDUAL_CAPTURE	Prevention of re-use of recorded voice samples

The TOE Security Functional Requirements are implemented by the following TOE Security Functions:

Table 1: TOE Security Functions

For more details please refer to the Security Target [7], chapter 6.1.

The claimed TOE's Strength of Functions 'medium' (SOF-medium) for specific functions as indicated in the Security Target [7], chapter 6.2 is confirmed.

The assets to be protected by the TOE are defined in the Security Target [7], chapter 3.1. Based on these assets the TOE Security Environment is defined in terms of Assumptions, Threats and Organisational Security Policies. This is outlined in the Security Target [7], chapter 3.2 to 3.4.

This certification covers the following configurations of the TOE:

The evaluated configuration was a VoiceIdent Unit 2.0 (subsystem versions and files in accordance with table 2 and the configuration list) installed on one machine and restricted to the local development network.

The certification results only apply to the version of the product indicated in the certificate and on the condition that all the stipulations are kept as detailed in this Certification Report. This certificate is not an endorsement of the IT product by the Federal Office for Information Security (BSI) or any other organisation that recognises or gives effect to this certificate, and no warranty of the IT product by BSI or any other organisation that recognises or gives effect to this certificate, is either expressed or implied.

## 2 Identification of the TOE

The Target of Evaluation (TOE) is called:

#### VoiceIdent Unit 2.0

The following table outlines the TOE deliverables:

No	Туре	Identifier	Release	Form of Delivery			
1	SW	Voice Gateway / Sikom	Version	Installed at the customer's site			
		Sikom VoiceMan 7.5	7.5.3.156	by technicians of the developer			
2	SW	ASR/Verifier		Installed at the customer's site			
		Nuance ASR 9.0 / Verifier 3.5	Version 9.0 SP1	by technicians of the developer			
3	SW	Application Server		nstalled at the customer's site			
		Jakarta Tomcat 5.5	Version 5.5.26	by technicians of the developer			
		SV-VoiceDialog	Version 2.0				
		SV-Webservice	Version 2.0				
4	SW	Admin Server		Installed at the customer's site			
		SV-AdminSrv	Version 2.0	by technicians of the developer			
5	Paper and PDF	Administration Guide VoiceIdent Unit 2.0	Version 2.0.4	Handed personally resp. installed at the customer's site by technicians of the developer			

Table 2: Deliverables of the TOE

## 3 Security Policy

The Security Policy is expressed by the set of Security Functional Requirements and implemented by the TOE. It covers the following issues:

The TOE provides access to a portal to authorised users and provides access to the TOEs management functions to authorised administrators only.

Therefore the TOE enforces the following rules:

- A user has access to the user data behind the portal only after forwarding the claimed ID to the TOE and successful voice verification.
- After the successful username/password authentication on the Admin-Server, the TOE administrator can
  - administrate the users (store, change and delete the user identity data and the biometric identification records (BIR)),
  - perform the TOE relevant settings and check the audit records,
  - reset the counter of consecutive unsuccessful attempts for the user,
  - change his own password.

- After the successful username/password authentication on the operating system the IT administrator has access to the subsystem "Admin-Server" via a command line program and can
  - administrate the TOE administrators incl. reset the counter of consecutive unsuccessful attempts for the TOE administrator,
  - change his own username/password.
- After the successful username/password authentication on the operating system the Developer-Administrator can perform the installation of the TOE with IT administrator supports and set (once) the threshold value for acceptance or rejection of user authentication attempts.

## **4** Assumptions and Clarification of Scope

The Assumptions defined in the Security Target and some aspects of Threats and Organisational Security Policies are not covered by the TOE itself. These aspects lead to specific Security Objectives to be fulfilled by the TOE-Environment. The following topics are of relevance:

- Trained and trustworthy administrators
- Suitable capture devices, in this case normal telephones or VoIP-devices
- Enrolment process
- Sufficient quality and secure storage of biometric identification records (BIR)
- Adequate and well administered IT-infrastructure (operating system, databases, network)
- Secure environment (except capture devices)
- Availability of a fallback mechanism for the biometric verification system

Details can be found in the Security Target [7] chapter 4.2.

The TOE is a biometric system that works in verification mode. Biometric identification is not addressed within the evaluation. Furthermore the enrolment process is out of scope and it is assumed that all authorized users have been enrolled.

For correct operation the TOE needs cryptographically strong random numbers and reliable timestamps that are provided by the underlying plattform.

The biometric identification records that are produced during the enrolment process as well as all other user identification data are stored in two databases that are outside the TOE.

For more detailed information about the the TOE boundary see the following chapter in this report and the Security Target [7], chapter 2.5.

## **5** Architectural Information

The following diagram shows the TOE in its intended environment. The TOE consists of the four software subsystems Voice Gateway/Sikom, ASR/Verifier, Application Server (containing the VoiceXML Dialog and the BusinessLogic) and Admin Server that are marked by blue boxes and that implement the TOE Security Functionality. The TOE boundary is shown by the light violett box which surrounds the subsystems. The black arrows named S1, S2, S4 and S7 – S12 indicate the external interfaces of the TOE. The black arrows named S3, S5 and S6 indicate the internal interfaces of the TOE.

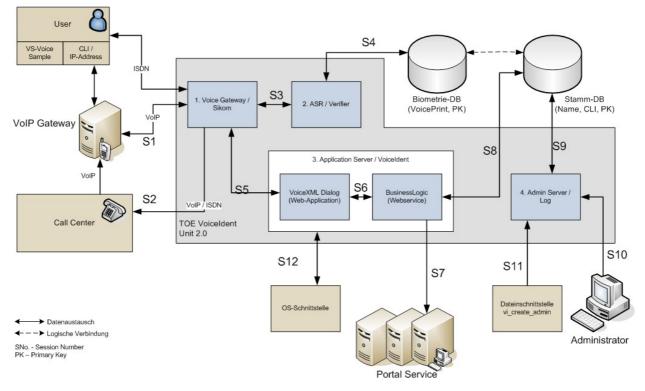

Figure 1: Architecture of the TOE

## 6 Documentation

The evaluated documentation as outlined in table 2 is being provided with the product to the customer. This documentation contains the required information for secure usage of the TOE in accordance with the Security Target.

Additional obligations and notes for secure usage of the TOE as outlined in chapter 10 of this report have to be followed.

## 7 IT Product Testing

#### 7.1 Test Configuration

The used test configuration was a VoiceIdent Unit 2.0 (subsystem versions and files in accordance with the configuration list) installed on one machine (a Fujitsu-Siemens RX200 S2 Server with 2 Intel Xeon 3,6 GHz prozessors, 4 GB RAM, 2 x 72 GB harddisks and an Eicon Diva Server 4BRI-8M 2.0 ISDN card, operating system Windows Server 2003 Standard-Edition, Service Pack 1) and restricted to the local development network. That meant that no external email-addresses were available and in the verification process rejected users were not forwarded to a call centre. Except these restrictions the used test configuration was conform to the Security Target. But for all the restrictions complete testing of the TOE Security Functions was possible without any qualification.

#### 7.2 Developer Testing

The developer specified and implemented test cases for each defined Security Function. Each test case covered one Security Function and the test procedures were based on the described behaviour of the Security Function. All Security Functions were covered and the actual test results were conform to the expected test results.

#### 7.3 Evaluator Indenpendent Testing

The evaluators used the test configuration installed and used by the developer for the developer tests. The hardware and software used by the evaluators for testing were the same as the ones used by the developer, because the tests took place in the test environment of the developer.

Taking into account the results of the developer's tests the evaluators specified tests by varying existing tests. Only for the residual tests the evaluators did not specify varying tests, because the tests of the developer are adequate to cover the Security Function behaviour. The evaluators conducted at least one test case for each Security Function. One evaluator test could be understood as penetration test for obvious attacks (a user trying to authenticate with a recorded voice sample). The evaluator recorded his own voice sample and used it for the authentication attempt. The authentication failed. All actual test results were conform to the expected test results.

## 8 Evaluated Configuration

This certification covers the following configurations of the TOE:

The TOE is identified as VoiceIdent Unit 2.0.

The evaluated configuration was a VoiceIdent Unit 2.0 (subsystem versions and files in accordance with table 2 and the configuration list) installed on one machine and restricted to the local development network.

For setting up and running the TOE according to the evaluated configuration all guidance documents (refer to chapter 6) and the implications given by the Security Target were followed. These implications can also be found in chapter 1 and 4 of this report.

## **9** Results of the Evaluation

#### 9.1 CC specific results

The Evaluation Technical Report (ETR) [8] was provided by the ITSEF according to the Common Criteria [1], the Methodology [2], the requirements of the Scheme [4] and all interpretations and guidelines of the Scheme (AIS) [5] as relevant for the TOE.

The following guidance specific for the technology was used:

The Biometrics Evaluation Methodology Supplement (BEM) [3] was used for the evaluation of the biometric verification mechanism.

As a result of the evaluation the verdict PASS is confirmed for the following assurance components:

- All components of the class ASE
- All components of the EAL 2 package as defined in the CC (see also part C of this report)
- The components ADV\_SPM.1 augmented for this TOE evaluation.

As the evaluation work performed for this certification procedure was carried out as a reevaluation based on the certificate BSI-DSZ-CC-0359-2007, re-use of specific evaluation tasks was possible. The focus of this re-evaluation was on the extension to the VoIPtechnology besides normal telephony (that is extension of capture devices to VoIP-devices besides normal telephones in the IT environment of the TOE and update of the Voice Gateway in the TOE), the adding of the database types IBM DB2 and the Microsoft SQLServer besides the Oracle 9.2 DBMS (databases are IT environment of the TOE) and update of the automatic speech recognition software Nuance ASR 9.0 to the latest version.

The evaluation has confirmed:

•	PP Conformance:	Protection Profile - Biometric Verification Mechanisms,
		Varian 1.04

BSI-PP-0016-2005 [10]	

- for the Functionality: PP conformant Common Criteria Part 2 conformant
- for the Assurance: Common Criteria Part 3 conformant EAL 2 augmented by ADV\_SPM.1
- The following TOE Security Functions fulfil the claimed Strength of Function : medium F.BIO\_VERIFICATION, F.NO\_REPRODUCE\_ OR\_RESIDUAL\_CAPTURE and F.AUTHADMIN

In order to assess the Strength of Function for the TOE Security Function F.BIO\_VERIFICATION the Biometrics Evaluation Methodology Supplement (BEM) [3] was used

The results of the evaluation are only applicable to the TOE as defined in chapter 2 and the configuration as outlined in chapter 8 above.

### 9.2 Results of cryptographic assessment

The TOE does not include cryptoalgorithms. Thus, no such mechanisms were part of the assessment.

## 10 Obligations and notes for the usage of the TOE

The operational documents as outlined in table 2 contain necessary information about the usage of the TOE and all security hints therein have to be considered.

## **11 Security Target**

For the purpose of publishing, the Security Target [7] of the Target of Evaluation (TOE) is provided within a separate document as Annex A of this report.

#### 12.2 Glossary

Augmentation - The addition of one or more assurance component(s) from CC Part 3 to an EAL or assurance package.

**Extension** - The addition to an ST or PP of functional requirements not contained in part 2 and/or assurance requirements not contained in part 3 of the CC.

**Formal** - Expressed in a restricted syntax language with defined semantics based on wellestablished mathematical concepts.

Informal - Expressed in natural language.

**Object** - An entity within the TSC that contains or receives information and upon which subjects perform operations.

**Protection Profile** - An implementation-independent set of security requirements for a category of TOEs that meet specific consumer needs.

**Security Function** - A part or parts of the TOE that have to be relied upon for enforcing a closely related subset of the rules from the TSP.

**Security Target** - A set of security requirements and specifications to be used as the basis for evaluation of an identified TOE.

Semiformal - Expressed in a restricted syntax language with defined semantics.

**Strength of Function** - A qualification of a TOE security function expressing the minimum efforts assumed necessary to defeat its expected security behaviour by directly attacking its underlying security mechanisms.

**SOF-basic** - A level of the TOE strength of function where analysis shows that the function provides adequate protection against casual breach of TOE security by attackers possessing a low attack potential.

**SOF-medium** - A level of the TOE strength of function where analysis shows that the function provides adequate protection against straightforward or intentional breach of TOE security by attackers possessing a moderate attack potential.

**SOF-high** - A level of the TOE strength of function where analysis shows that the function provides adequate protection against deliberately planned or organised breach of TOE security by attackers possessing a high attack potential.

Subject - An entity within the TSC that causes operations to be performed.

**Target of Evaluation** - An IT product or system and its associated administrator and user guidance documentation that is the subject of an evaluation.

**TOE Security Functions** - A set consisting of all hardware, software, and firmware of the TOE that must be relied upon for the correct enforcement of the TSP.

**TOE Security Policy** - A set of rules that regulate how assets are managed, protected and distributed within a TOE.

**TSF Scope of Control** - The set of interactions that can occur with or within a TOE and are subject to the rules of the TSP.

## C Excerpts from the Criteria

CC Part1:

#### **Conformance results** (chapter 7.4)

"The conformance result indicates the source of the collection of requirements that is met by a TOE or PP that passes its evaluation. This conformance result is presented with respect to CC Part 2 (functional requirements), CC Part 3 (assurance requirements) and, if applicable, to a pre-defined set of requirements (e.g., EAL, Protection Profile).

The conformance result consists of one of the following:

- **CC Part 2 conformant** A PP or TOE is CC Part 2 conformant if the functional requirements are based only upon functional components in CC Part 2.
- **CC Part 2 extended** A PP or TOE is CC Part 2 extended if the functional requirements include functional components not in CC Part 2.

plus one of the following:

- **CC Part 3 conformant** A PP or TOE is CC Part 3 conformant if the assurance requirements are based only upon assurance components in CC Part 3.
- **CC Part 3 extended** A PP or TOE is CC Part 3 extended if the assurance requirements include assurance requirements not in CC Part 3.

Additionally, the conformance result may include a statement made with respect to sets of defined requirements, in which case it consists of one of the following:

- Package name Conformant A PP or TOE is conformant to a pre-defined named functional and/or assurance package (e.g. EAL) if the requirements (functions or assurance) include all components in the packages listed as part of the conformance result.
- Package name Augmented A PP or TOE is an augmentation of a pre-defined named functional and/or assurance package (e.g. EAL) if the requirements (functions or assurance) are a proper superset of all components in the packages listed as part of the conformance result.

Finally, the conformance result may also include a statement made with respect to Protection Profiles, in which case it includes the following:

PP Conformant - A TOE meets specific PP(s), which are listed as part of the conformance result."

#### CC Part 3:

#### **Protection Profile criteria overview** (chapter 8.2)

"The goal of a PP evaluation is to demonstrate that the PP is complete, consistent, technically sound, and hence suitable for use as a statement of requirements for one or more evaluatable TOEs. Such a PP may be eligible for inclusion within a PP registry.

"Assurance Class	Assurance Family				
	TOE description (APE_DES)				
	Security environment (APE_ENV)				
Class APE: Protection Profile evaluation	PP introduction (APE_INT)

	IT security requirements (APE_REQ)				
	Explicitly stated IT security requirements (APE_SRE)				

Table 3 - Protection Profile families - CC extended requirements"

#### Security Target criteria overview (Chapter 8.3)

"The goal of an ST evaluation is to demonstrate that the ST is complete, consistent, technically sound, and hence suitable for use as the basis for the corresponding TOE evaluation.

"Assurance Class	Assurance Family

Table 5 - Security Target families - CC extended requirements "

### Assurance categorisation (chapter 7.5)

"The assurance classes, families, and the abbreviation for each family are shown in Table 1.

Assurance Class	Assurance Family				
	CM automation (ACM_AUT)				
ACM: Configuration management	CM capabilities (ACM_CAP)				
	CM scope (ACM_SCP)				
ADO: Delivery and operation	Delivery (ADO_DEL)				
	Installation, generation and start-up (ADO_IGS)				
	Functional specification (ADV_FSP)				
	High-level design (ADV_HLD)				
	Implementation representation (ADV_IMP)				
ADV: Development	TSF internals (ADV_INT)				
	Low-level design (ADV_LLD)				
	Representation correspondence (ADV_RCR)				
	Security policy modeling (ADV_SPM)				
AGD: Guidance documents	Administrator guidance (AGD_ADM)				
	User guidance (AGD_USR)				
	Development security (ALC_DVS)				
ALC: Life cycle support	Flaw remediation (ALC_FLR)				
	Life cycle definition (ALC_LCD)				
	Tools and techniques (ALC_TAT)				
	Coverage (ATE_COV)				
ATE: Tests	Depth (ATE_DPT)				
	Functional tests (ATE_FUN)				
	Independent testing (ATE_IND)				
	Covert channel analysis (AVA_CCA)				
AVA: Vulnerability assessment	Misuse (AVA_MSU)				
	Strength of TOE security functions (AVA_SOF)				
	Vulnerability analysis (AVA_VLA)				

Table 1: Assurance family breakdown and mapping"

#### Evaluation assurance levels (chapter 11)

"The Evaluation Assurance Levels (EALs) provide an increasing scale that balances the level of assurance obtained with the cost and feasibility of acquiring that degree of assurance. The CC approach identifies the separate concepts of assurance in a TOE at the end of the evaluation, and of maintenance of that assurance during the operational use of the TOE.

It is important to note that not all families and components from CC Part 3 are included in the EALs. This is not to say that these do not provide meaningful and desirable assurances. Instead, it is expected that these families and components will be considered for augmentation of an EAL in those PPs and STs for which they provide utility."

#### Evaluation assurance level (EAL) overview (chapter 11.1)

"Table 6 represents a summary of the EALs. The columns represent a hierarchically ordered set of EALs, while the rows represent assurance families. Each number in the resulting matrix identifies a specific assurance component where applicable.

As outlined in the next section, seven hierarchically ordered evaluation assurance levels are defined in the CC for the rating of a TOE's assurance. They are hierarchically ordered inasmuch as each EAL represents more assurance than all lower EALs. The increase in assurance from EAL to EAL is accomplished by substitution of a hierarchically higher assurance component from the same assurance family (i.e. increasing rigour, scope, and/ or depth) and from the addition of assurance components from other assurance families (i.e. adding new requirements).

These EALs consist of an appropriate combination of assurance components as described in chapter 7 of this Part 3. More precisely, each EAL includes no more than one component of each assurance family and all assurance dependencies of every component are addressed.

While the EALs are defined in the CC, it is possible to represent other combinations of assurance. Specifically, the notion of "augmentation" allows the addition of assurance components (from assurance families not already included in the EAL) or the substitution of assurance components (with another hierarchically higher assurance component in the same assurance family) to an EAL. Of the assurance constructs defined in the CC, only EALs may be augmented. The notion of an "EAL minus a constituent assurance component" is not recognised by the standard as a valid claim. Augmentation carries with it the obligation on the part of the claimant to justify the utility and added value of the added assurance component to the EAL. An EAL may also be extended with explicitly stated assurance requirements.

Assurance Class	Assurance Family	Assurance Evaluation Assurance		irance Le	Components ance Level			by
		EAL1	EAL2	EAL3	EAL4	EAL5	EAL6	EAL7

Table 6: Evaluation assurance level summary"

#### Evaluation assurance level 1 (EAL1) - functionally tested (chapter 11.3)

#### "Objectives

EAL1 is applicable where some confidence in correct operation is required, but the threats to security are not viewed as serious. It will be of value where independent assurance is required to support the contention that due care has been exercised with respect to the protection of personal or similar information.

EAL1 provides an evaluation of the TOE as made available to the customer, including independent testing against a specification, and an examination of the guidance documentation provided. It is intended that an EAL1 evaluation could be successfully conducted without assistance from the developer of the TOE, and for minimal outlay.

An evaluation at this level should provide evidence that the TOE functions in a manner consistent with its documentation, and that it provides useful protection against identified threats."

#### Evaluation assurance level 2 (EAL2) - structurally tested (chapter 11.4)

"Objectives

EAL2 requires the co-operation of the developer in terms of the delivery of design information and test results, but should not demand more effort on the part of the developer than is consistent with good commercial practice. As such it should not require a substantially increased investment of cost or time.

EAL2 is therefore applicable in those circumstances where developers or users require a low to moderate level of independently assured security in the absence of ready availability of the complete development record. Such a situation may arise when securing legacy systems, or where access to the developer may be limited."

# **Evaluation assurance level 3 (EAL3) - methodically tested and checked** (chapter 11.5)

#### "Objectives

EAL3 permits a conscientious developer to gain maximum assurance from positive security engineering at the design stage without substantial alteration of existing sound development practices.

EAL3 is applicable in those circumstances where developers or users require a moderate level of independently assured security, and require a thorough investigation of the TOE and its development without substantial re-engineering."

# Evaluation assurance level 4 (EAL4) - methodically designed, tested, and reviewed (chapter 11.6)

"Objectives

EAL4 permits a developer to gain maximum assurance from positive security engineering based on good commercial development practices which, though rigorous, do not require substantial specialist knowledge, skills, and other resources. EAL4 is the highest level at which it is likely to be economically feasible to retrofit to an existing product line.

EAL4 is therefore applicable in those circumstances where developers or users require a moderate to high level of independently assured security in conventional commodity TOEs and are prepared to incur additional security-specific engineering costs."

# **Evaluation assurance level 5 (EAL5) - semiformally designed and tested** (chapter 11.7)

"Objectives

EAL5 permits a developer to gain maximum assurance from security engineering based upon rigorous commercial development practices supported by moderate application of specialist security engineering techniques. Such a TOE will probably be designed and developed with the intent of achieving EAL5 assurance. It is likely that the additional costs attributable to the EAL5 requirements, relative to rigorous development without the application of specialised techniques, will not be large.

EAL5 is therefore applicable in those circumstances where developers or users require a high level of independently assured security in a planned development and require a rigorous development approach without incurring unreasonable costs attributable to specialist security engineering techniques."

# **Evaluation assurance level 6 (EAL6) - semiformally verified design and tested** (chapter 11.8)

"Objectives

EAL6 permits developers to gain high assurance from application of security engineering techniques to a rigorous development environment in order to produce a premium TOE for protecting high value assets against significant risks.

EAL6 is therefore applicable to the development of security TOEs for application in high risk situations where the value of the protected assets justifies the additional costs."

# **Evaluation assurance level 7 (EAL7) - formally verified design and tested** (chapter 11.9)

#### "Objectives

EAL7 is applicable to the development of security TOEs for application in extremely high risk situations and/or where the high value of the assets justifies the higher costs. Practical application of EAL7 is currently limited to TOEs with tightly focused security functionality that is amenable to extensive formal analysis."

#### Strength of TOE security functions (AVA\_SOF) (chapter 19.3)

#### "Objectives

Even if a TOE security function cannot be bypassed, deactivated, or corrupted, it may still be possible to defeat it because there is a vulnerability in the concept of its underlying security mechanisms. For those functions a qualification of their security behaviour can be made using the results of a quantitative or statistical analysis of the security behaviour of these mechanisms and the effort required to overcome them. The qualification is made in the form of a strength of TOE security function claim."

#### Vulnerability analysis (AVA\_VLA) (chapter 19.4)

#### "Objectives

Vulnerability analysis is an assessment to determine whether vulnerabilities identified, during the evaluation of the construction and anticipated operation of the TOE or by other methods (e.g. by flaw hypotheses), could allow users to violate the TSP.

Vulnerability analysis deals with the threats that a user will be able to discover flaws that will allow unauthorised access to resources (e.g. data), allow the ability to interfere with or alter the TSF, or interfere with the authorised capabilities of other users."

#### "Application notes

A vulnerability analysis is performed by the developer in order to ascertain the presence of security vulnerabilities, and should consider at least the contents of all the TOE deliverables including the ST for the targeted evaluation assurance level. The developer is required to document the disposition of identified vulnerabilities to allow the evaluator to make use of that information if it is found useful as a support for the evaluator's independent vulnerability analysis."

"Independent vulnerability analysis goes beyond the vulnerabilities identified by the developer. The main intent of the evaluator analysis is to determine that the TOE is resistant to penetration attacks performed by an attacker possessing a low (for AVA\_VLA.2 Independent vulnerability analysis), moderate (for AVA\_VLA.3 Moderately resistant) or high (for AVA\_VLA.4 Highly resistant) attack potential."
