

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Release

About this document

Scope and purpose

This document is the Security Target for the Infineon security controllers IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12 with optional Crypto Suite.

Intended audience

Composite product developers, Common Criteria evaluators and certifiers.

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Introduction (ASE_INT)

1 Introduction (ASE_INT)

1.1 ST reference

The ST has the title IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12 Security Target, Rev. 2.8 and is dated 2025-07-02.

1.2 TOE reference

The full TOE name is:

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12 with firmware version 80.505.04.1 or 80.511.00.0, optional HSL version 04.05.0040, optional UMSLC version 02.01.0040, optional Crypto Suite version 05.02.002, optional NRG™ version 06.10.0002 or 06.10.0005, optional Ascon-128 MISE version 1.1.2, optional SHA256 MISE version 1.1.1 and user guidance documents

The TOE is identified by the components as described in the physical scope, chapter 1.4.2.

- The Hardware version, design step and Firmware version can be read out form the chip by the Generic Chip Identification Mode (GCIM). The procedure how to read that data is described in the Programmers Reference Manual.
- The correct library versions can be verified by the corresponding hash values as defined in chapter 8. The correct user guidance documents can be verified by Table 3.

1.3 TOE overview

1.3.1 TOE definition and usage

The TOE consists of a smart card IC (Security Controller), firmware and user guidance meeting high requirements in terms of performance and security. The TOE is designed by Infineon Technologies AG and is intended to be used in smart cards for security-relevant applications and as developing platform for smart card operating systems according to the life cycle model from [PP0084]. The TOE is the platform for the Embedded Software but the Embedded Software itself is not part of the TOE. The TOE does not require any non-TOE hardware/software/firmware.

1.3.2 TOE major security features

- Dual CPU in lockstep mode to detect integrity errors during processing
- Memory integrity protection
- Memory encryption
- Bus masking for security peripherals
- Hardware True RNG
- Symmetric coprocessor for AES encryption and decryption
- Coprocessor to accelerate long integer and modular arithmetic operations for asymmetric cryptography. It relies on the embedded software to implement securely cryptographic algorithms.
- Global alarm system with security life control

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Introduction (ASE_INT)

- Tearing safe NVM write
- Armv8-M compliant MPU and SAU
- Robust set of sensors and detectors
- Redundant alarm propagation and system deactivation principle
- Peripheral access control
- Leakage control of data dependent code execution
- · Device phase management
- The optional Crypto Suite provides hardened cryptographic functions for AES, TDES, RSA, ECC, finite field DH, Hash, HMAC functions and deterministic random number generators.
- The MISE provides masked and side-channel hardened arithmetical and logical CPU instructions.
- Instruction Stream Signature (ISS) coprocessor. The ISS can optionally be used to protect the CPU
 instruction flow. The hardware-based integrity protection concept of the TOE already provides a very
 effective program flow protection, such that the ISS is actually not needed. The ISS can nevertheless be
 used for compatibility reasons or as a very conservative additional countermeasure.

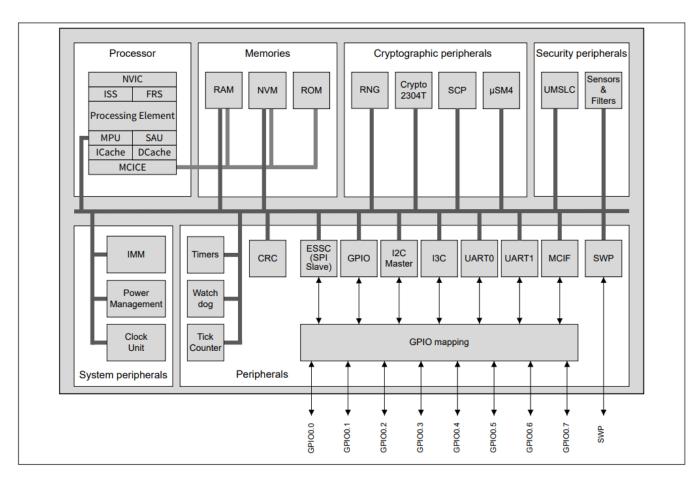

1.4 TOE description

1.4.1 TOE components

1.4.1.1 TOE hardware

Figure 1 shows schematically the TOE hardware.

Figure 1 TOE hardware

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Introduction (ASE_INT)

The TOE hardware consists of the following blocks:

- Processor
 - CPU according to Armv8-M mainline architecture.
 - Armv8-M compatible NVIC controller
 - Armv8-M compatible Memory Protection Unit (MPU) with 8 regions
 - Armv8-M compatible Security Attribution Unit (SAU) with 8 regions
 - Instruction Stream Signature (ISS) coprocessor
 - Fast Random Source (FRS) nonce generator coprocessor
 - EDC protected caches for memory access and instruction fetch
 - MCICE provides encryption and EDC protection for RAM, ROM and NVM
- Memories
 - encrypted and EDC protected ROM
 - encrypted and EDC protected RAM
 - encrypted and EDC protected NVM
- Peripherals
 - Timers
 - Watchdog
 - Tick counter
 - CRC accelerator
- System peripherals
 - Clock unit
 - Interface Management Module (IMM)
 - Power Management
 - System Peripheral Access Unit (SPAU) to manage access to peripherals.
- Cryptographic peripherals
 - RNG according to class PTG.2 of [AIS 31]
 - Crypto2304T coprocessor for long modular integer arithmetic
 - SCP for secure AES computation
 - μSM4 accelerator for SM4 cryptographic algorithm.
- · Security peripherals
 - UMSLC
 - Sensors
- I/O Interfaces
 - UART for ISO 7816-3
 - I3C slave which can also be used as I2C slave
 - I2C master
 - SPI slave
 - SWP slave
 - Miller interface
 - GPIO ports

The TOE has a global alarm system that puts the TOE into a secure state after tamper detection.

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Introduction (ASE_INT)

1.4.1.2 Firmware

The TOE Firmware consists of the Boot software, which provides secure start-up and contains the Flash Loader code.

1.4.1.3 Libraries

The TOE can be ordered with the following libraries to support the security coding of embedded software:

- UMSLC library to test the chips sensors
- HSL library to provide tearing safe write for the NVM

The TOE can optionally be ordered with the following certified libraries to support the security coding of embedded software:

- Crypto Suite library to provide certified cryptographic functions
- Ascon-128 MISE and SHA256 MISE libraries and application notes

In addition, the TOE can be ordered with the NRG[™] SW library. This is a proprietary cryptographic protocol for transport and ticketing applications. Please note that NRG[™] is not part of the TSF.

1.4.2 Physical scope

1.4.2.1 Hardware/Firmware

Table 1 Hardware/Firmware components

CC Version	Design Step	Firmware	Flash Loader
IFX_CCI_000068h	G12	80.505.04.1	10.01.0001
IFX_CCI_000080h			
IFX_CCI_000097h			
IFX_CCI_000099h			
IFX_CCI_000093h	R11, R12	80.511.00.0	10.01.0001

1.4.2.2 Libraries

The following libraries can be optionally ordered.

Table 2 Libraries

Component	Version
HSL	04.05.0040
UMSLC	02.01.0040
NRG™	06.10.0002
	06.10.0005
Crypto Suite	5.02.002
Ascon-128 MISE	1.1.2
SHA256 MISE	1.1.1

Note: The user guidance for the UMSLC, NRG™ and HSL libraries is located in the Programmers Reference Manual. The Crypto Suite library comes with dedicated user guidance.

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Introduction (ASE_INT)

1.4.2.3 User guidance documents

The following table lists the guidance documents belonging to the product variant CCI.

SHA256 MISE Application Note	1.1.2	2023-09-13	

1.4.3 Logical scope

The logical scope of the TOE consists of the logical security features provided by the TOE. These features are listed in chapter 1.3.2. This chapter explains the features in more detail.

The following features of the TOE are part of the TSF:

- The Processor has a duplicated CPU running in lockstep mode to detect integrity errors. The CPU registers and the cache RAM are protected by 32-bit ECC codes used as an EDC.
- ROM, RAM and NVM content is cryptographically encrypted according to [AIS 46]
- ROM, RAM and NVM content is integrity protected by an EDC with at least 28 bits.
- A hardware true RNG according to class PTG.2 of [AIS 31].
- A symmetric coprocessor for performing masked AES ECB encryption.
- The data buses connecting the CPU and the cryptographic peripherals are encrypted using a bus encryption with dynamic keys which are changed in each transfer.
- Peripheral access control can be used to provide individual access control of all peripherals for the different security states of the processor (i.e. secure/non-secure, privilege/non-privilege).
- The chip has the following sensors
 - voltage low and high
 - temperature low and high
 - low frequency

Security Target Lite

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Introduction (ASE_INT)

- light fault attack detectors
- If the values are out of range a security alarm is issued.
- Security Life control is used to check proper working of sensors and alarm system by runtime triggered tests.
- In case the core or a peripheral detects a security violation it performs three countermeasures
 - goes into local alarm state
 - propagates the alarm to the other peripherals and core which then go also into alarm state
 - triggers a security reset.
- The HSL detects if NVM has not been correctly written due to a tearing event. The next time an HSL function
 is called, the embedded software is informed by the HSL that a tearing event has occurred. The HSL
 provides functions to correct the corrupted data by either roll-back or roll-forward.
- The Armv8-M Memory Protection Unit (MPU) and Security Attribution Unit (SAU) with 8 regions each are provided which can be used as a logical firewall for the embedded software.
- If the chip is switched to User mode it cannot be switched back to Test mode. If the Flash Loader is permanently disabled, it cannot be reactivated again.
- The Masked Instruction Set Extension (MISE) coprocessor provides an Armv8-M Custom Data path Extension (CDE) with side-channel improved (masked) variants of common 32-bit instructions. The most important instructions are MAND, MBIC, MEOR, MORN, MORR, MADD and MSUB (with and without carries).
 - Application notes will be provided which show the implementation of SHA2-256 and the Ascon authenticated encryption with MISE instructions.
- The optional Crypto Suite supporting
 - RSA key generation, encryption and signature up to 4224 bits
 - ECDSA and ECDH up to 521 bits
 - Brainpool curves, NIST curves, W-25519, Koblitz secp256k1, BN P256, ANSII FRP256V1
 - AES 128, 192,256 in different chaining modes and CMAC
 - TDES 112,168 in different chaining modes
 - HMAC with SHA-1 and SHA-2
 - SHA-1 and SHA-2 Hash
 - RNG functions supporting PTG.2, PTG.3, DRG.3, DRG.4 according to [AIS 20] and [AIS 31]
- The processor system comes with several supporting features to assist side-channel protected software implementations. One common software countermeasure is masking. However, the user needs to take special care when processing masked data together with its masks to avoid that they (or parts of them) are unintentionally combined in hardware resulting in a degradation of the desired side-channel security level. Therefore, the processor system has several measures in place to support the software in keeping the masked data and masks separated.
- Fast Random Source (FRS) nonce generator coprocessor. This RNG was not evaluated according to [AIS 31]
 and its output shall therefore not be used for applications requiring a certified RNG. It is used internally to
 support security features of the security architecture.
- Program flow integrity protection: The Instruction Stream Signature (ISS) coprocessor can optionally be used by the IC embedded software to detect illegal program flows and trigger an alarm.
- A coprocessor for accelerating long arithmetic operations to support RSA and ECC cryptography. This coprocessor has no dedicated security countermeasures. The embedded software must implement security countermeasures. Appropriate countermeasures are provided by the optional Crypto Suite library.

The TOE has memory-mapped registers as interfaces to the peripherals.

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Introduction (ASE_INT)

The interfaces to the libraries are C language APIs.

1.4.4 TOE delivery

The TOE delivery formats and delivery lifecycle according to [PP0084] application note 1 are shown in the following table.

Table 4 Forms of delivery

Component	Format	Life cycle	Delivery method	
Hardware	bare die (sawn wafer)	3	Customer chooses delivery method. This ST	
	PG-X2QFN-20	4	describes under which circumstances transport	
	CSP	4	protection is provided by the TOE.	
Firmware	binary image	3 or 4 ¹	In ROM/NVM of hardware	
Libraries	object files	n/A	secure download via iShare	
Documents	personalized PDF	n/A	secure download via iShare	
	ASCII readme text ²			

Note: The Ascon-128 MISE and SHA256 MISE libraries will also be provided as source code.

1.4.5 Production sites

The TOE may be handled at different production sites, but the silicon is produced at TSMC fab 15 in Taiwan only. The production site can be determined by reading out the GCIM.

1.4.6 Configurations

This TOE is represented by various configurations called products. The module design, layout and footprint, of all products are identical. The degree of freedom for configuring the TOE is predefined by Infineon Technologies AG. Table 5 shows TOE hardware/firmware configurations. The chip must be ordered with the desired NVM value. The value cannot be changed afterwards. Bill per Use is not supported.

Table 5 TOE configuration options

Component	Values	Identification
NVM	800, 1024, 1800 kb	IFX mailbox

1.4.7 Initialisation with embedded software

This TOE is equipped with Flash Loader software (FL) to download user software, i.e. an operating system and applications. Various options can be chosen by the user to store software onto the NVM.

 Table 6
 Order Options to initialize the TOE with customer software

Option	TOE status
The user or/and a subcontractor	The Flash Loader can be activated or reactivated by the user or
downloads the software into the NVM.	subcontractor to download software into NVM. In case the Flash
Infineon Technologies does not receive	Loader is active, it may be either in life cycle stage "Pinletter" or
any user software.	"Activated". When "Activated" a mutual authentication needs

¹ depends on hardware delivery format

² Documentation of MISE libraries will be delivered as ASCII readme files. All other documentation will be delivered in PDF form.

Security Target Lite

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Introduction (ASE_INT)

Option	TOE status
	to be performed. In "Pinletter" a valid Pinletter provided by Infineon Technologies AG needs to be presented to enter "Activated" stage.
The user provides software to download into NVM to Infineon Technologies AG. The software is loaded into NVM during chip production.	There is no Flash Loader present.
The user provides software to download into NVM to Infineon Technologies AG. The software is loaded into NVM during chip production.	The Flash Loader is blocked by Infineon but can be activated or reactivated by the user or subcontractor to download software into NVM. The user is required to provide a reactivation procedure as part of the software to Infineon Technologies AG.
The user provides software to download into NVM to Infineon Technologies AG. The software is loaded into NVM during chip production.	The Flash Loader is active. The user can either download software or activate the software already present in NVM.

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Conformance (ASE_CCL)

2 Conformance (ASE_CCL)

2.1 Conformance claims

This ST and TOE claim conformance to

- [CC2] extended
- [CC3] conformant

2.1.1 PP claims

This ST is strictly conformant to [PP0084]. The assurance level is EAL6 with the augmentation ALC_FLR.1.

The Security IC Platform Protection Profile with Augmentation Packages is registered and certified by the Bundesamt für Sicherheit in der Informationstechnik (BSI) under the reference [PP0084].

2.1.2 Package claims

This ST claims conformance to the following additional packages taken from [PP0084]:

- Package Authentication of the Security IC, section 7.2, conformant.
- Package Loader, Package 1: Loader dedicated for usage in secured environment only, section 7.3.1, conformant.
- Package Loader, Package 2: Loader dedicated for usage by authorized users only, section 7.3.2, augmented.
- Package TDES; section 7.4.1, augmented. This package is only claimed if the optional Crypto Suite 5.02.002 is available.
- Package AES; section 7.4.2, augmented.

Note: The Loader Packages are only claimed if the user has ordered the TOE with active Flash Loader

The assurance level for the TOE is EAL6 augmented with the component ALC_FLR.1. Therefore, this ST is package-augmented to the packages in [PP0084].

2.2 Conformance rationale

The TOE is a typical security IC as defined in [PP0084].

The security problem definition of [PP0084] is enhanced by adding the Organisational Security Policy P.Firewall due to addition of the Armv8-M Memory Protection Unit and Security Extension. The security target remains conformant to [CC1] due to claim 289 as the possibility to introduce additional restrictions is given. The security target fulfils the strict conformance claim of [PP0084] due to application note 5.

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Security Problem Definition (ASE_SPD)

3 Security Problem Definition (ASE_SPD)

3.1 Threats

3.1.1 Threats from PP0084

The following threats are defined and described in [PP0084] sections 3.2 and 7.2.1.

Table 7 Threats from [PP0084]

Threat	Description
T.Phys-Manipulation	Physical Manipulation
T.Phys-Probing	Physical Probing
T.Malfunction	Malfunction due to Environmental Stress
T.Leak-Inherent	Inherent Information Leakage
T.Leak-Forced	Forced Information Leakage
T.Abuse-Func	Abuse of Functionality
T.RND	Deficiency of Random Numbers
T.Masquerade_TOE	Masquerade the TOE

3.1.2 Threats defined in this ST

There are no additional threats defined in this ST.

3.2 Organizational security policies

3.2.1 Organizational security policies from PP0084

The organizational policies from [PP0084] sections 3.3, 7.3.1, 7.3.2 and 7.4 are applicable.

Table 8 Organisational Security Policies from [PP0084]

OSP	Description
P.Process-TOE	Protection during TOE Development and Production
P.Crypto-Service	Cryptographic services of the TOE
P.Lim_Block_Loader	Limiting and Blocking the Loader Functionality
P.Ctrl_Loader	Controlled usage to Loader Functionality

3.2.2 Organizational security policies defined in this ST

This ST defines an additional organisational security policy specific to the MPU Extension and Security Extension.

Table 9 Memory region-based access control

OSP	Definition
P.Firewall	The TOE must enable the IC dedicated software and the end-user
	embedded software to manage and control access to regions in memory.

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Security Problem Definition (ASE_SPD)

3.3 Assumptions

3.3.1 Assumptions defined in [PP0084]

The TOE assumptions about the operational environment are defined and described in [PP0084] section 3.4.

Table 10 Assumptions from [PP0084]

Assumption	Description
A.Process-Sec-IC	Protection during Packaging, Finishing and Personalization
A.Resp-Appl	Treatment of User Data

3.3.2 Assumptions defined in this ST

There are no additional assumptions defined in this ST.

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Security Objectives (ASE_OBJ)

Security Objectives (ASE_OBJ) 4

Security objectives for the TOE 4.1

Security objectives for the TOE defined in PP0084 4.1.1

Security objectives for the TOE from [PP0084] Table 11

Objective	Description
O.Phys-Manipulation	Protection against Physical Manipulation
O.Phys-Probing	Protection against Physical Probing
O.Malfunction	Protection against Malfunctions
O.Leak-Inherent	Protection against Inherent Information Leakage
O.Leak-Forced	Protection against Forced Information Leakage
O.Abuse-Func	Protection against Abuse of Functionality
O.Identification	TOE Identification
O.RND	Random Numbers
O.Cap_Avail_Loader	Capability and availability of the Loader
O.Ctrl_Auth_Loader	Access control and authenticity for the Loader
O.Authentication	Authentication to external entities
O.AES	Cryptographic service AES
O.TDES	Cryptographic service TDES

Security objectives for the TOE defined in this ST 4.1.2

Table 12 **Security Objectives for the TOE**

Objective	Definition
O.Firewall	Firewall based Access Control
	The TOE must provide the IC dedicated software and the end-user embedded software with the capability to define restricted memory access and code execution to memory addresses. The TOE must enforce the access of software to these memory regions depending on access attributes.
O.FFC	Finite Field cryptographic services
	The TOE shall provide the following specific security functionality to the
	Smartcard Embedded Software: Finite Field cryptographic services
O.RSA	RSA cryptographic services
	The TOE shall provide the following specific security functionality to the
	Smartcard Embedded Software: Rivest-Shamir-Adleman Cryptography (RSA)
O.ECC	Elliptic Curve cryptographic services
	The TOE shall provide the following specific security functionality to the
	Smartcard Embedded Software: Elliptic Curve Cryptography (ECC)
O.HMAC	HMAC Cryptographic services
	The TOE provides secure cryptographic services for HMAC calculation.

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Security Objectives (ASE_OBJ)

Objective	Definition
O.Hash	Cryptographic service hash
	The TOE provides secure cryptographic services for SHA-1 and SHA-2 generation.
O.MISE	Cryptographic services implemented with MISE
	The TOE provides secure cryptographic services implemented with the MISE instructions.

4.2 Security objectives for the operational environment (OE)

4.2.1 OEs defined in [PP0084]

Table 13 Security objectives for the operational environment from [PP0084]

Objective	Description
OE.Resp-Appl	Treatment of user data of the Composite TOE
OE.Process-Sec-IC	Protection during composite product manufacturing
OE.Lim_Block_Loader	Limitation of capability and blocking the Loader
OE.Loader_Usage	Secure communication and usage of the Loader
OE.TOE_Auth	External entities authenticating of the TOE

Note: OE.TOE_Auth is available if the Flash Loader is available.

4.2.2 OEs defined in this ST

Table 14 Additional Security objectives for the environment

Environmental objective	Description
OE.Secure_Delivery (only applicable if Flash Loader deactivated (i.e. cases 2 and 3 from Table 6)	When the TOE is ordered with a disabled Flash Loader, it does not provide transport protection. Therefore, technical and / or organisational security procedures (e.g. a custom mutual authentication mechanism or a security transport) should be put in place by the customer to secure the personalized TOE during delivery as required by the security needs of the loaded IC Embedded Software.

4.3 Security objectives rationale

The security objectives rationale of the TOE is defined and described in [PP0084] section 4.4, 7.3.1, 7.3.2 and section 7.4.2.

The objectives O.Firewall added in this ST cover the organisational security policy P.Firewall that states that IC dedicated software and end-user embedded software must be able to manage and control access to regions in memory.

The objectives O.FFC, O.RSA, O.ECC, O.HMAC, O.Hash and O.MISE cover the policy P.Crypto-Service. This policy intends to allow adding various cryptographic services to the TSF.

The objective OE.Secure_Delivery requires the customers to provide transport protection in case the TOE is delivered with flash loader deactivated (i.e. rows 2, 3 from Table 6). In that case O.Authentication is not available and needs to be compensated by customer measures. This environmental objective counters T.Masquerade_TOE.

Security Target Lite

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Extended Components Definition (ASE_ECD)

5 Extended Components Definition (ASE_ECD)

5.1 Extended components defined in [PP0084]

The [PP0084] defines the following extended components used in this ST:

- FMT_LIM.1
- FMT_LIM.2
- FAU_SAS.1
- FDP_SDC.1
- FCS_RNG.1
- FIA_API.1

5.2 Extended components defined in this ST

There are no extended components defined in this ST.

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Security Requirements (ASE_REQ)

6 Security Requirements (ASE_REQ)

6.1 Security functional requirements

For the CC operations the following convention is used:

- CC operations which have been already completed in [PP0084] or [AIS 31] are typeset without underline.
- CC (nested) iteration operations are started by a slash "/" symbol, followed by an iteration identifier text. Iterations may be recursively nested.
- CC operations which are completed in this ST are <u>underlined</u> and the assigned footnote shows the original template text. Iteration operations are typed in normal font (i.e. without underline).

6.1.1 Hardware random number generators

Random numbers generation according to Class PTG.2 of [AIS 31].

Table 15 FCS_RNG.1/TRNG

FCS_RNG.1/TRNG	Random Number Generation
Hierarchical to	No other components.
Dependencies	No dependencies.
FCS_RNG.1.1/TRNG	The TSF shall provide a physical random number generator that implements:
	(PTG.2.1) A total failure test detects a total failure of entropy source immediately when the RNG has started. When a total failure is detected, no random numbers will be output.
	(PTG.2.2) If a total failure of the entropy source occurs while the RNG is being operated, the RNG prevents the output of any internal
	random number that depends on some raw random numbers that have been generated after the total failure of the entropy source ¹ .
	(PTG.2.3) The online test shall detect non-tolerable statistical defects of the raw random number sequence (i) immediately when the RNG has started, and (ii) while the RNG is being operated. The TSF must not output any random numbers before the power-up online test has finished successfully or when a defect has been detected. (PTG.2.4) The online test procedure shall be effective to detect non-tolerable weaknesses of the random numbers soon.
	(PTG.2.5) The online test procedure checks the quality of the raw random number sequence. It is triggered <u>continuously</u> ² . The online test is suitable for detecting non-tolerable statistical defects of the statistical properties of the raw random numbers within an acceptable period of time.
FCS_RNG.1.2/TRNG	The TSF shall provide <u>32-bit numbers</u> ³ that meet

Release 20 Rev

¹ [selection: prevents the output of any internal random number that depends on some raw random numbers that have been generated after the total failure of the entropy source, generates the internal random numbers with a post-processing algorithm of class DRG.2 as long as its internal state entropy guarantees the claimed output entropy]

² [selection: externally, at regular intervals, continuously, applied upon specified internal events].

³ [selection: bits, octets of bits, numbers [assignment: format of the numbers]]

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Security Requirements (ASE_REQ)

FCS_RNG.1/TRNG	Random Number Generation
	(PTG.2.6) Test procedure A (None)¹ does not distinguish the internal random numbers from output sequences of an ideal RNG.
	(PTG.2.7) The average Shannon entropy per internal random bit exceeds 0.997.

6.1.2 Cryptographic services implemented in hardware

This chapter defines cryptographic algorithms which are directly supported by the hardware.

Table 16 FCS_COP.1/AES

FCS_COP.1/AES	Cryptographic operation
Hierarchical to	No other components.
Dependencies	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]
	FCS_CKM.4
FCS_COP.1.1/AES	The TSF shall perform decryption and encryption in accordance with a specified cryptographic algorithm AES in <u>ECB mode</u> ² and cryptographic key sizes <u>128 bit</u> , <u>192 bit</u> , <u>256 bit</u> ³ that meet the following: [FIPS 197], [SP 800-38A].

Note: The input to the AES algorithm must be provided in two XOR shares. By fixing one share to zero an ECB mode with one input results.

Table 17 FCS_CKM.4

FCS_CKM.4	Cryptographic key destruction
Hierarchical to	No other components.
Dependencies	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]
FCS_CKM.4.1	The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method <u>overwriting or zeroing</u> ⁴ that meets the following: <u>None</u> ⁵ .

6.1.3 Cryptographic algorithms implemented with MISE

This chapter defines the SFRs related to the optional libraries Ascon-128 MISE and SHA256 MISE . The library code is also provided as source code. The SFRs from this chapter are only applicable if those libraries are delivered.

¹ [assignment: additional standard test suites]

FCS_COP.1/SHA2	Cryptographic operation
Hierarchical to	No other components.
Dependencies	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]
	FCS_CKM.4
FCS_COP.1.1/SHA2	The TSF shall perform <u>Hash digest</u> ¹ in accordance with a specified cryptographic algorithm <u>SHA-256</u> ² and cryptographic key sizes <u>none</u> ³ that meet the following: [FIPS 180-4] ⁴ .

Table 19 FCS_COP.1/ASCON

FCS_COP.1/ASCON	Cryptographic operation
Hierarchical to	No other components.
Dependencies	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]
	FCS_CKM.4
FCS_COP.1.1/ASCON	The TSF shall perform <u>Authenticated encryption</u> ⁵ in accordance with a specified cryptographic algorithm <u>Ascon-128</u> ⁶ and cryptographic key sizes <u>128 bit</u> ⁷ that meet the following: <u>[ASCON]</u> ⁸ .

6.1.4 TSF testing

An attacker may try to circumvent the alarm system and secure wiring by physical manipulation (e.g. by cutting alarm lines). To counter those threats, the chip provides the User Mode Life Cycle (UMSLC) tests to check the integrity of those security features. Those test functions are provided as a software library and can be triggered on demand of the Embedded Software of the Composite TOE.

Table 20 TSF testing

FPT_TST.1	TSF testing
Hierarchical to	No other components.
Dependencies	No dependencies.
FPT_TST.1.1	The TSF shall run a suite of self-tests <u>at the request of the authorized user</u> ⁹ to demonstrate the correct operation of <u>alarm test and security optimized wiring tests</u> ¹⁰ .

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Security Requirements (ASE_REQ)

FPT_TST.1	TSF testing
FPT_TST.1.2	The TSF shall provide authorized users with the capability to verify the integrity of the boot code ¹ .
FPT_TST.1.3	The TSF shall provide authorized users with the capability to verify the integrity of <u>alarm behavior and security optimized wiring</u> ² .

Note: If the integrity of the boot code is violated, a security reset is triggered. The authorized user (i.e. the embedded software) can check if a security reset has been performed by reading the reset status register.

6.1.5 Malfunctions

This chapter relates to the section "Malfunctions" in [PP0084] ch. 6.1.

The SFRs FRU_FLT.2 and FPT_FLS.1 are specified in [PP0084].

Secure state of the TOE

Application note 14 of FPT_FLS.1 requires to define the secure state of the TOE.

Definition: A **secure state** of the TOE is either a correct operation or one of the following exceptional states

- security reset
- global deactivation of the TOE (a.k.a. alarm state)
- fault handler

6.1.6 Abuse of Functionality

This chapter relates to the section "Abuse of Functionality" in [PP0084] ch. 6.1.

The SFRs FMT_LIM.1 and FMT_LIM.2 are specified in [PP0084].

Table 21 FAU_SAS.1

FAU_SAS.1	Audit Storage
Hierarchical to	No other components.
Dependencies	No dependencies.
FAU_SAS.1.1	The TSF shall provide the test process before TOE delivery ³ with the capability to store the initialization data and/or pre-personalization data and/or supplements of the security IC embedded software ⁴ in the access protected and not changeable areas of the non-volatile memory ⁵ .

 $^{^{\}mbox{\tiny 1}}$ [selection: [assignment: parts of TSF data], TSF data]

Security Requirements (ASE_REQ)

6.1.7 Physical Manipulation and Probing

This chapter relates to the section "Physical Manipulation and Probing" in [PP0084] ch. 6.1.

The SFR FPT_PHP.3 is specified in [PP0084].

Automatic response of the TOE

Application note 19 of FPT_PHP.3 requires to define the automatic response of the TOE. Definition: An **automatic response of the TOE** means entering a secure state of the TOE.

Table 22 FDP_SDC.1

FDP_SDC.1	Stored data confidentiality
Hierarchical to	No other components.
Dependencies	No dependencies
FDP_SDC.1.1	The TSF shall ensure the confidentiality of the information of the user data while it is stored in the RAM, ROM, and NVM ¹ .

Table 23 FDP_SDI.2

FDP_SDI.2	Stored data integrity monitoring and action
Hierarchical to	FDP_SDI.1
Dependencies	No dependencies.
FDP_SDI.2.1	The TSF shall monitor user data stored in containers controlled by the TSF for <u>EDC integrity errors</u> ² on all objects, based on the following attributes: <u>the corresponding EDC value with a length of at least 28 bits in the RAM, ROM, and NVM</u> ³ .
FDP_SDI.2.2	Upon detection of a data integrity error, the TSF shall <u>enter a secure</u> <u>state</u> ⁴.

6.1.8 Leakage

This chapter relates to the section "Leakage" in [PP0084] ch. 6.1.

The SFRs FDP_ITT.1, FPT_ITT.1 and FDP_IFC.1 are specified in [PP0084].

6.1.9 Application Firewall

The Application Firewall allows the embedded software to execute in four security levels and to assign access conditions to the address space related to the security levels. The security levels are:

- secure privilege
- secure non-privilege

Release 24 Rev. 2.8

¹ [assignment: memory area]

² [assignment: integrity errors]

³ [assignment: user data attributes]

⁴ [assignment: action to be taken]

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Security Requirements (ASE_REQ)

- non-secure privilege
- non-secure non-privilege

The policy allows the embedded software to enforce the following trust relationship

- secure doesn't trust non-secure independent of the privilege level
- secure privilege doesn't trust secure non-privilege
- non-secure privilege doesn't trust non-secure non-privilege

6.1.9.1 Policy definition

Subjects:

Processor

Objects:

Memory addresses

Operations:

- FETCH(x): any instruction fetch from address x
- READ(x): any read access from address x
- WRITE(x): any write access to address x
- SG: secure gateway instruction
- BNS: any of the branch to non-secure code instructions
- FNC_RETURN: return from secure mode to non-secure mode
- HANDLER_S: call of any secure handler code. Of specific importance for this policy are the following handlers:
 - MEMFAULT_S: memory fault handler in secure mode
 - SECFAULT: security fault handler
- HANDLER_NS: call of any non-secure handler code. Of specific importance for this policy is the following handler:
 - MEMFAULT_NS: memory fault handler in non-secure mode
- EXC_RETURN: return from handler code

Security attributes for processor:

- sec: Boolean attribute designating secure/non-secure with values
 - true: processor is in secure mode.
 - false: processor is non-secure mode.
- handlermode: Boolean attribute designating handler / thread mode:
 - true: processor is in handler mode
 - false: processor is in thread mode

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Security Requirements (ASE_REQ)

- nPriv_S: Boolean attribute designating privilege mode when sec = true with values.
 - true: processor runs in non-privilege mode.
 - false: processor runs in privilege mode.
- nPriv_NS: Boolean attribute designating privilege mode when sec = false with values.
 - true: processor runs in non-privilege mode.
 - false: processor runs in privilege mode.

Security attributes for addresses:

- PO(x): Boolean attribute assigned to address x.
 - true: Only privilege mode has access.
 - false: Privilege and non-privilege mode have access.
- acc(x): {N, R, RW} attribute assigned to address x.
 - N: no access allowed.
 - R: write access is declined
 - RW: read and write access is not declined.
- sec(x): {S, NS, NSC} attribute assigned to address x.
 - S: secure address.
 - NS: non-secure address.
 - NSC: secure address which is callable from non-secure address.
- XN(x): Boolean variable assigned to address x.
 - true: instruction fetch is declined.
 - false: instruction fetch is not declined.

Definitions:

privileged := handlermode or (not nPriv_S and sec) or (not nPriv_NS and not sec)

Rules:

- FETCH(x) is declined if (sec = false and sec(x) = S) or (sec = false and sec(x) = NSC and FETCH(x) ≠ SG)
- READ(x) is declined if sec = false and sec(x) ≠ NS
- 3. WRITE(x) is declined if $\sec = \text{false and } \sec(x) \neq \text{NS}$
- FETCH(x) is declined if (privileged = false and PO(x) = true)

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Security Requirements (ASE_REQ)

or (XN(x) = true)or (acc(x) = N)

 READ(x) is declined if (privileged = false and PO(x) = true) or (acc(x) = N)

 WRITE(x) is declined if (privileged = false and PO(x) = true) or (acc(x) ≠ RW)

- 7. If one of rules 1, 2, 3 apply then the SECFAULT handler will be called.
- 8. If one of rules 4, 5 or 6 apply but none of rules 1, 2, 3 and sec=true then MEMFAULT_S handler will be called.
- 9. If one of rules 4, 5 or 6 apply but none of rules 1, 2, 3 and sec=false then MEMFAULT_NS handler will be called.
- 10. Modification of sec to value true is only allowed for SG, FNC_RETURN, EXC_RETURN or HANDLER_S.
- 11. Modification of sec to value false is only allowed for BNS and EXC_RETURN.
- 12. Modification of nPriv_S to value false is only allowed when handlermode = true and sec = true.
- 13. Modification of nPriv_S to value true is only allowed when sec = true.
- 14. Modification of nPriv_NS to value false is only allowed when handlermode = true or (sec = true and nPriv_S = false).
- 15. Modification of handlermode to value true is only allowed for HANDLER_S or HANDLER_NS.
- 16. Modification of handlermode to value false is only allowed for EXC_RETURN.
- 17. Modification of nPriv_NS to value true is only allowed when privileged = true

Roles for management:

The parameter x designates any address.

- secure AF management: privileged = true and sec = true
- non-secure AF management: privileged = true

6.1.9.2 SFRs

Table 24 FDP_ACC.2/AF

FDP_ACC.2/AF	Complete access control
Hierarchical to	FDP_ACC.1
Dependencies	FDP_ACF.1
FDP_ACC.2.1/AF	The TSF shall enforce the <u>Application Firewall access control policy</u> ¹ on <u>subjects</u> , <u>objects and operations defined in 6.1.9.1</u> ² and all operations among subjects and objects covered by the SFP.
FDP_ACC.2.2/AF	The TSF shall ensure that all operations between any subject controlled by the TSF and any object controlled by the TSF are covered by an access control SFP.

Security Requirements (ASE_REQ)

FMT_SMR.1/AF	Security Roles
FMT_SMR.1.2/AF	The TSF shall be able to associate users with roles.

6.1.10 Authentication of the Security IC

The TOE shall implement the Package "Authentication of the Security IC" from [PP0084], ch. 7.2.

Table 31 FIA_API.1

FIA_API.1	Authentication Proof of Identity
Hierarchical to	No other components.
Dependencies	No dependencies.
FIA_API.1.1	The TSF shall provide a <u>authentication mechanism according to</u> [ISO9798 2] section 7.3.3, Mechanism MUT.CR-Three-pass authentication ¹ to prove the identity of the TOE to an external entity.

Note: FIA_API is only available, if the Flash Loader is active.

6.1.11 Flash loader

The TOE provides a Flash Loader to download user data into the NVM, either during production of the TOE or at customer site. This TOE shall support both Loader packages from [PP0084] section 7.3.

- Package 1: Loader dedicated for usage in secured environment only
- Package 2: Loader dedicated for usage by authorized users only

The SFRs FDP_UCT.1 and FDP_UIT.1 are specified in [PP0084].

Table 32 FMT_LIM.1/Loader

FMT_LIM.1/Loader	Limited Capabilities - Loader
Hierarchical to	No other components.
Dependencies	FMT_LIM.2
FMT_LIM.1.1/Loader	The TSF shall be designed and implemented in a manner that limits its capabilities so that in conjunction with "Limited availability (FMT_LIM.2)" the following policy is enforced: Deploying Loader functionality after permanent deactivation ² does not allow stored user data to be disclosed or manipulated by unauthorized user.

Table 33 FMT_LIM.2/Loader

FMT_LIM.2/Loader	Limited availability - Loader
Hierarchical to	No other components.
Dependencies	FMT_LIM.1
FMT_LIM.2.1/Loader	The TSF shall be designed in a manner that limits its availability so that in conjunction with "Limited capabilities (FMT_LIM.1)" the following

² [assignment: action]

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Security Requirements (ASE_REQ)

FMT_LIM.2/Loader	Limited availability - Loader
	policy is enforced: The TSF prevents deploying the Loader functionality
	after permanent deactivation ¹ .

Note: The User Guidance for this TOE requires the Flash Loader to be permanently deactivated prior delivery to the end user (Phase 7).

Table 34 FTP_ITC.1

FTP_ITC.1	Inter-TSF trusted channel
Hierarchical to	No other components.
Dependencies	No dependencies.
FTP_ITC.1.1	The TSF shall provide a communication channel between itself and Administrator User or Download Operator User and Image Provider ² that is logically distinct from other communication channels and provides assured identification of its end points and protection of the channel data from modification or disclosure.
FTP_ITC.1.2	The TSF shall permit another trusted IT product to initiate communication via the trusted channel.
FTP_ITC.1.3	The TSF shall initiate communication via the trusted channel for deploying Loader <u>for downloading User Data and modification of authentication keys</u> ³ .

Note: The download operation is authenticated by the Administrator User or the Download Operator User but the download image may be encrypted and authenticated by a different role. This role is called the "Image Provider". Thus, the download operation provides in effect a trusted channel between the Image Provider and the Flash Loader.

Table 35 FDP_ACC.1/Loader

FDP_ACC.1/Loader	Subset access control - Loader
Hierarchical to	No other components.
Dependencies	FDP_ACF.1
FDP_ACC.1.1/Loader	The TSF shall enforce the Loader SFP on
·	(1) the subjects Administrator User, Download Operator User and
	<u>Image Provider</u> ⁴,
	(2) the objects user data in <u>NVM</u> ⁵ ,
	(3) the operation deployment of Loader.

Table 36 FDP_ACF.1/Loader

⁵ [assignment: memory areas]

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Security Requirements (ASE_REQ)

FDP_ACF.1/Loader	Security attribute based access control - Loader
FDP_ACF.1.1/Loader	The TSF shall enforce the Loader SFP to objects based on the
	following:
	(1) the subjects <u>Administrator User</u> , <u>Download Operator User and</u>
	<u>Image Provider</u> ¹ with security attributes <u>None</u> ² .
	(2) the objects user data in <u>NVM</u> ³ with security attributes <u>None</u> ⁴ .
FDP_ACF.1.2/Loader	The TSF shall enforce the following rules to determine if an operation
_ ,	among controlled subjects and controlled objects is allowed:
	The authenticated Administrator User or authenticated Download
	Operator User can replace the user data by new user data when the
	new user data is authorized by the Image Provider ⁵ .
FDP_ACF.1.3/Loader	The TSF shall explicitly authorise access of subjects to objects based
	on the following additional rules: <u>None</u> ⁶ .
FDP_ACF.1.4/Loader	The TSF shall explicitly deny access of subjects to objects based on the
	following additional rules: <u>None</u> ⁷ .

The Image provider authenticates with the flash loader implicitly by providing a correctly signed and encrypted download image. An Image provider authentication must always be preceded by an Administrator User or Download Operator User authentication.

SFRs added in this ST 6.1.11.1

The following SFRs have been added to the SFRs from Flash Loader package 2 of [PP0084] in order to describe the management of the various Flash Loader authentication keys.

Table 37 FMT_MTD.1/Loader

FMT_MTD.1/Loader	Management of TSF data
Hierarchical to	No other components.
Dependencies	FMT_SMR.1
	FMT_SMF.1
FMT_MTD.1.1/Loader	The TSF shall restrict the ability to modify, delete ⁸ the Authentication
	keys for Administrator User, Download Operator User and Image
	<u>Provider</u> ⁹ to <u>Administrator User, Download Operator User</u> ¹⁰ .

Note: The Administrator User can manage the keys for Administration User, Download Operator User and Image Provider.

The Download Operator User can delete the key for Image Provider and Download Operator and modify keys for the Download Operator User only.

Hierarchical to	No other components.
Dependencies	[FCS_CKM.2 or FCS_COP.1]
	FCS_CKM.4
FCS_CKM.1.1/CS/RSA/ <iter></iter>	The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [assignment: cryptographic key generation algorithm] and specified cryptographic key sizes [assignment: cryptographic key sizes] that meet the following: [assignment: list of standards].

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Security Requirements (ASE_REQ)

The operations performed in this SFR are defined in the following table. Please note that **<iter>** is a placeholder for different SFR iterations defined in the first column.

Table 54 Cryptographic table for FCS_CKM.1/CS/RSA/<iter>

<iter></iter>	[assignment: cryptographic key generation algorithm]	[assignment: cryptographic key sizes]	[assignment: list of standards]
PRIMES	generate probably random primes p and q	512-2064 bits	[FIPS 186-4], B.3.3 w/o Step 1 [FIPS 186-5], A.1.3 w/o Step 1
EXP	generate RSA (N, d) parameters from p, q	1024-2112 bits	[FIPS 186-4], B.3.1 [PKCS#1], 3.1, 3.2(1) [FIPS 186-5], A.1.1
CRT	generate RSA CRT parameters from p, q	1024-4224 bits	[FIPS 186-4], B.3.1 [FIPS 186-5], A.1.1 [PKCS#1], 3.1, 3.2(2)
MR	Miller-Rabin primality test	512-2064 bits	[FIPS 186-4], ch. C.3.1 [FIPS 186-5], B.3.1
EMR	Enhanced Miller–Rabin primality test	512-2064 bits	[FIPS 186-4], ch. C.3.2 [FIPS 186-5], ch. B.3.2

Note: The key size in PRIMES, MR and EMR are related to each individual prime of the resulting RSA key. This means, the resulting RSA key $n = p^*q$ can have key size between 1024 and 4128 bits.

Note: PRIMES is only conformant to [FIPS 186-4], B.3.3 for prime Bitlength >= 1024; in case prime Bitlength < 1024 identical algorithm is used, but considered proprietary)

Note: PRIMES is only conformant to [FIPS 186-5], A.1.3 for prime Bitlength >= 2048; in case prime Bitlength < 2048 identical algorithm is used but considered proprietary.

Note: EXP generates N and d by two different API calls. The primes p, q must be calculated with the PRIMES algorithm.

Note: CRT does not explicitly generate d as described in [FIPS 186-4], B.3.1, but instead generates the CRT representation of d as described in [PKCS#1], 3.2(2). The primes p, q must be calculated with the PRIMES algorithm

Note: CRT does not explicitly generate d as described in [FIPS 186-5], A.1.1, but instead generates the CRT representation of d as described in [PKCS#1], 3.2(2). The primes p, q must be calculated with the PRIMES algorithm.

Note: The listed algorithms are cryptographic primitives which can be used by the composite TOE to generate RSA keys. The embedded application must implement the complete RSA key generation.

6.1.12.6 ECC

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Security Requirements (ASE_REQ)

Table 55 FCS_COP.1/CS/ECC/<iter>

FCS_COP.1/CS/ECC/ <iter></iter>	Cryptographic operation
Hierarchical to	No other components.
Dependencies	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]
	FCS_CKM.4
FCS_COP.1.1/CS/ECC/ <iter></iter>	The TSF shall perform [assignment: list of cryptographic operations] in accordance with a specified cryptographic algorithm [assignment: cryptographic algorithms] and cryptographic key sizes [assignment: cryptographic key sizes] that meet the following: [assignment: list of standards].

The operations performed in this SFR are defined in the following table. Please note that **<iter>** is a placeholder for different SFR iterations defined in the first column.

Table 56 Cryptographic table for FCS_COP.1/CS/ECC/<iter>

<iter></iter>	[assignment: list of cryptographic operations]	[assignment: cryptographic algorithms]	[assignment: cryptographic key sizes]	[assignment: list of standards]
ECDSA_SIG	EC signature generation	ECDSA	160-521 bits	[FIPS 186-4], ch. 6.4 [FIPS 186-5], ch. 6.4.1
ECDSA_VER	EC signature verification	ECDSA	160-521 bits	[FIPS 186-4], ch. 6.4 [FIPS 186-5], ch. 6.4.2
ECDH	key agreement	ECDH	160-521 bits	[SP 800-56A], ch. 5.7.1.2 without cofactor multiplication
PACE_IM	PACE integrated mapping	PACE integrated mapping	160-521 bits	[ICAO], Appendix B.2

Note: The ECDSA_SIG and ECDSA_VER operations will not perform a hash calculation of the input message.

Note: The ECDH operation returns the y-coordinate in addition to the x-coordinate.

Note: The ECDH operation does not perform cofactor multiplication. In case of curves with cofactor > 1, the embedded software must provide appropriate means to prevent the small subgroup attacks.

The following table lists the certified elliptic curves. Please note that the Crypto Suite supports any curve in short Weierstrass form up to 521 bits.

Table 57 Certified elliptic curves

6.1.12.8 Random

This section describes random number generation provided by the Crypto Suite.

Table 61 FCS_RNG.1/CS/PTG2

FCS_RNG.1/CS/PTG2	Random Number Generation
Hierarchical to	No other components.
Dependencies	No dependencies.
FCS_RNG.1.1/CS/PTG2	The TSF shall provide a physical random number generator that implements:
	(PTG.2.1) A total failure test detects a total failure of entropy source immediately when the RNG has started. When a total failure is detected, no random numbers will be output.
	(PTG.2.2) If a total failure of the entropy source occurs while the RNG is being operated, the RNG prevents the output of any internal random number that depends on some raw random numbers that have been generated after the total failure of the entropy source ¹ .
	(PTG.2.3) The online test shall detect non-tolerable statistical defects of the raw random number sequence (i) immediately when the RNG has started, and (ii) while the RNG is being operated. The TSF must not output any random numbers before the power-up online test has finished successfully or when a defect has been detected.
	(PTG.2.4) The online test procedure shall be effective to detect non- tolerable weaknesses of the random numbers soon.
	(PTG.2.5) The online test procedure checks the quality of the raw random number sequence. It is triggered <u>continuously</u> ² . The online test is suitable for detecting non-tolerable statistical defects of the statistical properties of the raw random numbers within an acceptable period of time.
FCS_RNG.1.2/CS/PTG2	The TSF shall provide <u>32-bit numbers</u> that meet (PTG.2.6) Test procedure A (None) ⁴ does not distinguish the internal
	random numbers from output sequences of an ideal RNG.

¹ [selection: prevents the output of any internal random number that depends on some raw random numbers that have been generated after the total failure of the entropy source, generates the internal random numbers with a post-processing algorithm of class DRG.2 as long as its internal state entropy guarantees the claimed output entropy]

² [selection: externally, at regular intervals, continuously, applied upon specified internal events]

³ [selection: bits, octets of bits, numbers [assignment: format of the numbers]]

⁴ [assignment: additional standard test suites]

IFX_CCI_000068h/80h/97h/99h G12 and IFX_CCI_000093h R11/R12

Security Requirements (ASE_REQ)

FCS_RNG.1/CS/PTG2	Random Number Generation
	(PTG.2.7) The average Shannon entropy per internal random bit
	exceeds 0.997.

Note: The PTG.2 API provided by the Crypto Suite is only a wrapper to the hardware-provided PTG.2 defined in section 6.1.1.

Table 62 FCS_RNG.1/CS/PTG3

FCS_RNG.1/CS/PTG3	Random number generation
Hierarchical to	No other components.
Dependencies	No dependencies.
FCS_RNG.1.1/CS/PTG3	The TSF shall provide a hybrid physical random number generator that implements:
	(PTG.3.1) A total failure test detects a total failure of entropy source immediately when the RNG has started. When a total failure is detected, no random numbers will be output.
	(PTG.3.2) If a total failure of the entropy source occurs while the RNG is being operated, the RNG <u>prevents the output of any internal random number that depends on some raw random numbers that have been generated after the total failure of the entropy source¹.</u>
	(PTG.3.3) The online test shall detect non-tolerable statistical defects of the raw random number sequence (i) immediately when the RNG has started, and (ii) while the RNG is being operated. The TSF must not output any random numbers before the power-up online test and the seeding of the DRG.3 post-processing algorithm have been finished successfully or when a defect has been detected.
	(PTG.3.4) The online test procedure shall be effective to detect non-tolerable weaknesses of the random numbers soon.
	(PTG.3.5) The online test procedure checks the raw random number sequence. It is triggered <u>continuously</u> ² . The online test is suitable for detecting non-tolerable statistical defects of the statistical properties of the raw random numbers within an acceptable period of time. (PTG.3.6) The algorithmic post-processing algorithm belongs to Class DRG.3 with cryptographic state transition function and cryptographic output function, and the output data rate of the post-processing algorithm shall not exceed its input data rate.
FCS_RNG.1.2/CS/PTG3	The TSF shall provide <u>numbers in 32-bit packets</u> that meet:
_ , ,	(PTG.3.7) Statistical test suites cannot practically distinguish the internal random numbers from output sequences of an ideal RNG. The internal random numbers must pass test procedure A (none) ⁴ .

¹ [selection: prevents the output of any internal random number that depends on some raw random numbers that have been generated after the total failure of the entropy source, generates the internal random numbers with a post-processing algorithm of class DRG.2 as long as its internal state entropy guarantees the claimed output entropy]

² [selection: externally, at regular intervals, continuously, upon specified internal events]

³ [selection: bits, octets of bits, numbers [assignment: format of the numbers]]

FCS_RNG.1/CS/DRG4	Random number generation
Hierarchical to	No other components.
Dependencies	No dependencies.
FCS_RNG.1.1/CS/DRG4	The TSF shall provide a hybrid deterministic random number generator that implements:

¹ [selection: use PTRNG of class PTG.2 as random source for the post-processing, have [assignment: work factor], require [assignment: guess work]]

² [selection: using a PTRNG of class PTG.2 as random source, using a PTRNG of class PTG.3 as random source, using an NPTRNG of class NTG.1 [assignment: other requirements for seeding]]

³ [selection: have [assignment: amount of entropy], have [assignment: work factor], require [assignment: guess work]]

⁴ [assignment: requirements for seeding]

⁵ [assignment: number of strings]

⁶ [assignment: probability]

⁷ [assignment: probability]

Security Requirements (ASE_REQ)

FCS_RNG.1/CS/DRG4	Random number generation
	(DRG.4.1) The internal state of the RNG shall <u>use PTRNG of class PTG.2 as random source¹</u> .
	(DRG.4.2) The RNG provides forward secrecy.
	(DRG.4.3) The RNG provides backward secrecy even if the current internal state is known.
	(DRG.4.4) The RNG provides enhanced forward secrecy on demand ² .
	(DRG.4.5) The internal state of the RNG is seeded by an <u>PTRNG of class</u> <u>PTG.2³</u> .
FCS_RNG.1.2/CS/DRG4	The TSF shall provide numbers that meet:
	(DRG.4.6) The RNG generates output for which 2^{48^4} strings of bit length 128 are mutually different with probability that is greater than $1-2^{(-24)^5}$.
	(DRG.4.7) Statistical test suites cannot practically distinguish the random numbers from the output sequences of an ideal RNG. The random numbers must pass test procedure A <u>and the U.S. National Institute of</u>
	Standards and Technology (NIST) test suite for RNGs used for cryptographic purposes [SP 800-22] ⁶ .

6.2 Security assurance requirements

In the following Table 65, the security assurance requirements and compliance rationale for augmented refinements are given.

Table 65 SAR list and refinements

SAR	Refinement
ADV_ARC.1	Refined in [PP0084]
ADV_FSP.5	The refinement of ADV_FSP.4 from [PP0084] can also be applied to the assurance level EAL 6 comprising ADV_FSP.5. The assurance component ADV_FSP.4 is extended to ADV_FSP.5 with aspects regarding the level of description. ADV_FSP.5 requires a semi-formal description in addition. The refinement is still valid.
ADV_IMP.2	The refinement of ADV_IMP.1 in [PP0084] requires the evaluator to check for completeness. In case of ADV_IMP.2 the entire implementation representation has to be provided anyhow. A check for completeness is also applicable in case the entire implementation representation is provided.
ADV_INT.3	No refinement
ADV_TDS.5	No refinement
ADV_SPM.1	No refinement
AGD_OPE.1	Refined in [PP0084]

ASE_TSS.1	No refinement
ATE_COV.3	The refinement of ATE_COV.2 in [PP0084] clarifies how to deal with testing of security mechanisms for physical protection. It further requests the TOE to be tested under different operating conditions. These refinements are also applicable for ATE_COV.3, which requires complete TSFI coverage.
ATE_DPT.3	No refinement
ATE_FUN.2	No refinement
ATE_IND.2	No refinement
AVA_VAN.5	Refined in [PP0084]

6.2.1 Security Policy Model (SPM) details

[CC3] requires in ADV_SPM.1.1D to define the not modelled SFRs.

The rational for the excluded SFRs are as follows:

- SFRs for cryptographic services are not modelled by convention
- SFRs for physical functions cannot be logically modelled
- SFRs for internal functions have no visible logical interface

The developer shall provide a formal security policy model for the <u>SFRs of this ST with the exception of the SFRs from the following table</u>¹.

Release

 $^{^{\}rm 1}$ [assignment: list of policies that are formally modelled]

6.3 Security requirements rationale

6.3.1 Rationale for the Security Functional Requirements

The security requirements rationale identifies the modifications and additions made to the rationale presented in [PP0084].

6.3.1.1 Additional SFRs related to O.Firewall

Table 67 Rationale for SFRs related to O.Firewall

SFR	Rationale
FDP_ACC.2/AF	The SFR with the respective SFP require the implementation of an areabased memory access control.
FDP_ACF.1/AF	The SFR allows the TSF to enforce access to objects within the respective SFP based on security attributes and defines these attributes and defines the rules based on these attributes that enable explicit decisions.
FMT_MSA.3/AF	The SFR requires that the TOE provides default values for the security attributes used in the SFP. Because the TOE is a hardware platform, these default values are generated by the reset procedure.
FMT_MSA.1/AF/S	The SFR requires that authorized users can manage TSF attributes. It ensures that the access control attributes associated to secure addresses can be managed only by code running in secure and privilege mode.
FMT_MSA.1/AF/NS	The SFR requires that authorized users can manage TSF attributes. It ensures that the access control attributes associated to non-secure addresses can be managed by code running in secure or non-secure privilege mode.

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Security Requirements (ASE_REQ)

SFR	Rationale
FMT_SMF.1/AF	The SFR is used for the specification of the management functions to be provided by the TOE. Being a hardware platform, the TOE allows the management of the security attributes by making the hardware registers accessible to software to enable modification.
FMT_SMR.1/AF	This SFR defines the roles used for management of the security attributes. The roles are defined by the security attribute of the fetch address of the CPU instruction.

6.3.1.2 Additional SFRs related to O.Ctrl_Auth_Loader

Table 68 Rationale for additional SFRs related to O.Ctrl_Auth_Loader

SFR	Rationale
FMT_MTD.1/Loader	This SFR requires that the TOE provides management functions for modification and deletion of authentication keys.
FMT_SMR.1/Loader	This SFR requires that the roles to management keys are defined
FMT_SMF.1/Loader	This SFR requires that the key management functions are defined
FIA_UID.2/Loader	This SFR requires that management functions can only be executed by authorized roles.

6.3.1.3 Additional SFRs related to O.Phys-Manipulation

The FPT_TST.1 component allows that particular parts of the security mechanisms and functions provided by the TOE can be tested after TOE delivery. This feature is important to detect direct physical manipulations by a FIB device in order to disable the alarm system of the chip.

6.3.1.4 Additional SFRs related to O.AES

The optional Crypto Suite provides the AES chaining modes ECB, CTR, CBC, CFB, CMAC, CBC-MAC, CCM and GCM modes. The associated SFRs are defined in chapter 6.1.12.1.

6.3.1.5 Additional SFRs related to O.TDES

The optional Crypto Suite provides the DES/TDES chaining modes ECB, CTR, CBC, CBC-MAC and Retail-MAC. The associated SFRs are defined in chapter 6.1.12.2.

6.3.1.6 Additional SFRs related to O.HMAC

The optional Crypto Suite provides the HMAC calculation. The associated SFR are defined in chapter 6.1.12.3

6.3.1.7 Additional SFRs related to O.FFC

The optional Crypto Suite provides Finite Field cryptographic services. The associated SFRs are defined in chapter 6.1.12.4.

6.3.1.8 Additional SFRs related to O.RSA

The optional Crypto Suite provides RSA functions. The associated SFRs are defined in chapter 6.1.12.5.

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

Security Requirements (ASE_REQ)

6.3.1.9 Additional SFRs related to O.ECC

The optional Crypto Suite provides ECC functions. The associated SFRs are defined in chapter 6.1.12.6.

6.3.1.10 Additional SFRs related to O.Hash

The optional Crypto Suite provides Hash functions. The associated SFRs are defined in chapter 6.1.12.7.

6.3.1.11 Additional SFRs related to O.RND

The optional Crypto Suite provides random functions. The associated SFRs are defined in chapter 6.1.12.8.

6.3.1.12 Additional SFRs related to O.MISE

Appnotes show how to efficiently implement cryptographic functions with the MISE instructions. The associated SFRs are defined in chapter 6.1.3.

6.3.2 Dependencies of Security Functional Requirements

The dependencies of the SFRs which are defined in [PP0084] are resolved in [PP0084], ch. 6.3.2. The following table lists the dependencies of the additional SFRs which are defined in this ST.

Table 69 Dependencies of SFRs

SFR	Dependencies	Rationale
FDP_ACC.2/AF	FDP_ACF.1	Fulfilled by FDP_ACF.1/AF
FDP_ACF.1/AF	FDP_ACC.1	Fulfilled by FDP_ACC.2/AF, which is hierarchically higher
FMT_MSA.3/AF	FMT_MSA.1	Fulfilled by FMT_MSA.1/AF/S and FMT_MSA.1/AF/NS
	FMT_SMR.1	Fulfilled by FMT_SMF.1/AF
FMT_MSA.1/AF/S FMT_MSA.1/AF/NS	FDP_ACC.1 or FDP_IFC.1	Fulfilled by FDP_ACC.2/AF, which is hierarchically higher
	FMT_SMR.1	Fulfilled by FMT_SMF.1/AF
	FMT_SMF.1	Fulfilled by FMT_SMF.1/AF
	FMT_SMR.1	Fulfilled by FMT_SMF.1/AF
	FMT_SMF.1	Fulfilled by FMT_SMF.1/AF
FMT_SMR.1/AF	FIA_UID.1	The dependency is satisfied, because the role is identified by the execution context of the processor.
FMT_SMF.1/AF	None	No dependency
FDP_ACC.1/Loader	FDP_ACF.1	Fulfilled by FDP_ACF.1/Loader
FDP_ACF.1/Loader	FMT_MSA.3	Not applicable, because there are no security attributes defined
FMT_MTD.1/Loader	FMT_SMR.1	Fulfilled by FMT_SMR.1/Loader
	FMT_SMF.1	Fulfilled by FMT_SMF.1/Loader
FMT_SMR.1/Loader	FIA_UID.1	Fulfilled by FIA_UID.2/Loader
FMT_SMF.1/Loader	None	No dependency
FIA_UID.2/Loader	None	No dependency
FPT_TST.1	None	No dependency
FCS_COP.1/AES	FCS_CKM.4	Fulfilled by FCS_CKM.4

Security Requirements (ASE_REQ)

SFR	Dependencies	Rationale
	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	The TOE does not provide services to generate symmetric keys. This will be done by the embedded software for the composite TOE.
FCS_CKM.4	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	The TOE does not provide services to generate or import symmetric keys. This will be done by the embedded software for the composite TOE.
FCS_COP.1/SHA2	FCS_CKM.4	n/A, as a hash function does not use keys.
	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	n/A, as a hash function does not use keys.
FCS_COP.1/ASCON	FCS_CKM.4	The TOE does not provide services to destroy symmetric ASCON keys. This will be done by the embedded software for the composite TOE.
	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	The TOE does not provide services to generate symmetric keys. This will be done by the embedded software for the composite TOE.
FCS_COP.1/CS/AES/ <iter></iter>	FCS_CKM.4	Fulfilled by FCS_CKM.4/CS/AES
	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	The TOE does not provide services to generate or import symmetric keys. This will be done by the embedded software for the composite TOE.
FCS_CKM.4/CS/AES	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	The TOE does not provide services to generate or import symmetric keys. This will be done by the embedded software for the composite TOE.
FCS_COP.1/CS/TDES/ <iter></iter>	FCS_CKM.4	Fulfilled by FCS_CKM.4/CS/TDES
	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	The TOE does not provide services to generate or import symmetric keys. This will be done by the embedded software for the composite TOE.
FCS_CKM.4/CS/TDES	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	The TOE does not provide services to generate or import symmetric keys. This will be done by the embedded software for the composite TOE.
FCS_COP.1/CS/FFC/ <iter></iter>	FCS_CKM.4	The TOE does not provide services to destroy FFC keys. This will be done by the embedded software for the composite TOE.
	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	The TOE does not provide services to generate or import FFC keys. This will be done by the embedded software for the composite TOE.
FCS_COP.1/CS/RSA/ <iter></iter>	FCS_CKM.4	The TOE does not provide services to destroy RSA keys. This will be done by the embedded software for the composite TOE.
	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	Fulfilled by FCS_CKM.1/CS/RSA/ <iter></iter>
FCS_CKM.1/CS/RSA/ <iter></iter>	FCS_CKM.2 or FCS_COP.1]	Fulfilled by FCS_COP.1/CS/RSA/ <iter></iter>

FCS_RNG.1/CS/PTG2	None	No dependency
FCS_RNG.1/CS/PTG3	None	No dependency
FCS_RNG.1/CS/DRG3	None	No dependency
FCS_RNG.1/CS/DRG4	None	No dependency

6.3.3 Rationale of the Assurance Requirements

The TOE is a typical security IC as defined in [PP0084]. The rationale for EAL level and augmentation is as follows.

An assurance level EAL6 with the augmentations ALC_FLR.1 is required for this type of TOE since it is intended to defend against highly sophisticated attacks without a protective environment. This evaluation assurance package was selected to permit a developer to gain maximum assurance from positive security engineering based on good commercial practices. In order to provide a meaningful level of assurance that the TOE provides an adequate level of defence against such attacks, the evaluators should have access to all information regarding the TOE including the TSF internals, the low level design and source code including the testing of the modular design. Additionally the mandatory technical document [JIL] shall be taken as a basis for the vulnerability analysis of the TOE.

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

TOE Summary Specification (ASE_TSS)

7 TOE Summary Specification (ASE_TSS)

The product overview is given in section 1.3.1. The Security Features are described below and the relation to the security functional requirements is shown. The TOE is equipped with the following security features to meet the security functional requirements:

Table 70 TOE Security Features

Security Feature	Description
SF_DPM	Device Phase Management
SF_PS	Protection against Snooping
SF_PMA	Protection against Modification Attacks
SF_PLA	Protection against Logical Attacks
SF_HC	Hardware provided Cryptography
SF_CS	Crypto Suite Services

7.1 SF_DPM: Device Phase Management

The life cycle of the TOE is split up into several phases (see [PP0084], ch. 1.2.3). Chip development and production (phase 2, 3, 4) and final use (phases 4-7) is a rough split-up from the TOE point of view. These phases are implemented in the TOE as test mode (phase 3) and user mode (phases 4-7). In addition a chip identification mode exists which is active in all phases. The chip identification data (O.Identification) is stored in a non-modifiable configuration page area of the non-volatile memory. Further TOE configuration data is stored in the same area. In addition, user initialization data can be stored in the NVM during the production phase as well. During this first data programming, the TOE is still in the secured environment and in test mode.

The covered security functional requirement is FAU_SAS.1 "Audit storage".

During start-up of the TOE the decision for one of the various operation modes is taken dependent on phase identifiers. The decision of accessing a certain mode is defined as phase entry protection. The phases follow also a defined and protected sequence. The sequence of the phases is protected by means of authentication.

The covered security functional requirements are FMT_LIM.1 and FMT_LIM.2.

During the production phase (phase 3 and 4) or after the delivery to the customer (phase 5 or phase 6), the TOE provides the possibility to download a user specific encryption key and user code and data into the empty (erased) NVM area as specified by the associated control information of the Flash Loader software. Alternatively in case the user has ordered TOE derivatives without Flash Loader, software download by the user (phase 5 or phase 6) is disabled and all user data of the embedded software is stored on the TOE at Infineon premises. In case the user has ordered the TOE derivatives with Flash Loader enabled, the Flash Loader may either be received in a way, which requires an authentic Pinletter and authentication afterwards, or it may be received in a state, which immediately requires successful mutual authentication. The Pinletter process can exchange the default authentication key. Successful authentication is required before being able to use the download functionality of the Flash Loader. Once authenticated, the functionality to exchange the Flash Loader keys depending on the user's identity is enabled. One of the keys, which can be exchanged is the Image Provider key. This key is used to decrypt and verify the integrity protected and encrypted download image. The authenticated user may also invalidate authentication keys depending on the user's identity. After finishing the download operation, the Flash Loader has to be permanently deactivated prior delivery to the end user, so that no further load operation with the Flash Loader is possible. The Flash Loader uses AES CCM mode [SP 800-38C] for encryption and integrity protection of payload and for authentication. For key usage diversification, the Flash Loader uses key derivation according to [SP 800-108].

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

TOE Summary Specification (ASE_TSS)

The covered security functional requirements are FMT_LIM.1/Loader, FMT_LIM.2/Loader, FTP_ITC.1, FDP_UCT.1, FDP_UIT.1, FDP_ACC.1/Loader, FDP_ACF.1/Loader, FMT_MTD.1/Loader, FMT_SMR.1/Loader, FMT_SMF.1/Loader, FIA_UID.2/Loader and FIA_API.1.

Note that the SFRs FTP_ITC.1, FDP_UCT.1, FDP_UIT.1, FDP_ACC.1/Loader, FDP_ACF.1/Loader, FMT_MTD.1/Loader, FMT_SMR.1/Loader, FMT_SMF.1/Loader, FIA_UID.2/Loader and FIA_API.1 are only part of the TOE if the flash loader is active.

Each operation phase is protected by means of authentication and encryption.

The covered security functional requirements are FDP_ITT.1 and FPT_ITT.1.

7.2 SF_PS: Protection against Snooping

All contents of the memories RAM, ROM and NVM of the TOE are encrypted on chip to protect them against data analysis. The encryption of the memory content is done by the MCICE using a proprietary cryptographic algorithm. A complex key management and address scrambling provides protection against cryptographic analysis attacks. All security relevant transfers via the peripheral bus are dynamically masked and thus protected against readout and analysis. Leakage of data dependent code execution can be reduced by employing specific hardware features.

In addition, the Masked Instruction Set Extension (MISE) coprocessor provides an Armv8-M Custom Data path Extension (CDE) with side-channel improved (masked) variants of common 32-bit instructions. This will provide additional means for the embedded software to minimize side channel leakage.

The covered security functional requirements are FDP_SDC.1, FDP_IFC.1, FPT_PHP.3, FPT_ITT.1, FPT_FLS.1 and FDP_ITT.1.

Most components of the design are synthesized to disguise allocation of elements to certain modules of the IC. Physical regularity of the logic functions is thereby removed. The covered security functional requirement is FPT_PHP.3.

A further protective design method used is security optimized wiring. Certain security-critical wires have been identified and protected by special routing measures against probing. Additionally specific signal lines, required to operate the device, are embedded into shield lines of the chip to prevent successful probing. The covered security functional requirements are FPT_PHP.3, FPT_ITT.1, FDP_ITT.1 and FDP_IFC.1.

A low system frequency sensor FSE is implemented to prevent the TOE from single stepping. The sensor is tested by the User Mode Security Life Control UMSLC. The UMSLC library provides some wrapper functionality around the UMSLC hardware part containing measures against fault attacks. The covered security functional requirements are FPT_PHP.3 and FPT_FLS.1.

7.3 SF_PMA: Protection against Modifying Attacks

The TOE has implemented a dual CPU running in lockstep mode and registers protected with 32 bit EDC. This mechanism reliably detects attacks on the code flow and data processed by the CPU. In the case of a detected attack, the TOE enters the secure state.

The TOE is equipped with a 28 bit EDC in RAM, a 28 bit EDC in NVM and a 32 bit EDC in ROM, which is realized in the MCICE peripheral. The EDC detects detect single- and multi-bit errors. In the case of an EDC error, the TOE enters the secure state.

The covered security functional requirements are FRU_FLT.2, FPT_PHP.3 and FDP_SDI.2.

A life test on internal security features is provided – it is called User Mode Security Life Control (UMSLC), which checks alarm lines for correct operation. This test can be triggered by user software during normal operation or via the UMSLC lib. If physical manipulation or a physical probing attack is detected, the TOE enters the secure

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

TOE Summary Specification (ASE_TSS)

state (as defined in chapter 6.1.5). To further decrease the risk of manipulation and tampering of the detection system a redundant alarm propagation and system deactivation is provided.

The covered security functional requirements are FPT_FLS.1, FPT_PHP.3 and FPT_TST.1

The Instruction Stream Signature Checking (ISS) calculates a hash over all executed instructions and automatically checks the correctness of this hash value. If the code execution follows an illegal path an alarm is triggered. This feature can optionally be used for program flow integrity protection but it is not needed as the dual CPU and memory EDC mechanisms are far better suited to detect such attacks.

The Online Configuration Check (OCC) function controls the modification of relevant system settings. It is also useful as a measure against fault attacks and accidental changes. The content of the protected registers is permanently hashed and checked against a reference value. A violation generates an alarm event and leads to the secure state.

The TOE supports dynamical locking of dedicated peripherals. This way data flow between CPU and peripherals can be controlled. Manipulations utilizing access to specific peripherals can be prevented with this locking mechanism.

As physical effects or manipulative attacks may also target the program flow of the user software, a watchdog timer and a check point register are implemented. These features allow the user to check the correct processing time and the integrity of the program flow of the user software.

The covered security functional requirements are FPT_FLS.1, FDP_IFC.1, FPT_ITT.1, FDP_ITT.1 and FPT_PHP.3.

The HSL provides tearing safe write operations which can be utilized by the embedded software.

The covered security functional requirement is FPT_PHP.3.

The correct function of the TOE is only given in the specified range of environmental operating parameters. To prevent an attack exploiting that circumstance the TOE is equipped with a temperature sensor, glitch sensor and voltage sensor as well as backside light detection. The TOE falls into the defined secure state in case of a specified range violation. The defined secure state causes the chip internal reset process.

The covered security functional requirements are FRU_FLT.2 "Limited fault tolerance" and FPT_FLS.1 "Failure with preservation of secure state ".

7.4 SF_PLA: Protection against Logical Attacks

The TOE implements the Armv8-M Memory Protection Unit (MPU) with 8 regions and the Security Attribution Unit (SAU) with 8 regions according to [Armv8-M], ch. B10.

The SAU contains an Implementation Defined Attribution Unit (IDAU). The IDAU exempts the address ranges 4000 0000H - 5FFF FFFFH and A000 0000H - FFFF FFFFH from Security attribution.

During each start-up of the TOE the address ranges and MPU access rights are initialized by the Boot Software (BOS) with predefined values. The BOS maps a small region containing the start-up code for access of privilege software.

The SAU is disabled, and all addresses are marked secure and non-secure not callable.

The covered security functional requirements are FDP_ACC.2/AF, FDP_ACF.1/AF, FMT_MSA.1/AF/S, FMT_MSA.1/AF/NS, FMT_MSA.3/AF, FMT_SMF.1/AF and FMT_SMR.1/AF.

7.5 SF_HC: Hardware provided cryptography

The TOE is equipped with a random number generator as defined in the SFRs FCS_RNG.1/TRNG in chapter 6.1.1.

public

Security Target Lite

IFX CCI 000068h/80h/97h/99h G12 and IFX CCI 000093h R11/R12

TOE Summary Specification (ASE_TSS)

The covered security functional requirement is FCS_RNG.1/TRNG.

The TOE supports the encryption and decryption in accordance with the Advanced Encryption Standard (AES) and cryptographic key sizes of 128 bits or 192 bits or 256 bits that meet the standards as defined in chapter 6.1.2.

The covered security functional requirement are FCS_COP.1/AES and FCS_CKM.4.

An SHA-256 algorithm and the Ascon [ASCON] lightweight cipher are implemented as app notes using MISE instructions in leakage sensitive parts of the code.

The covered security functional requirement are FCS_COP.1/SHA2 and FCS_COP.1/ASCON.

7.6 SF_CS: Crypto Suite Services

The optional Crypto Suite utilizes the symmetric coprocessor and the asymmetric coprocessor of the hardware to implement standard cryptographic algorithms.

For details, see the confidential ST.

Integrity	HMAC with SHA-1, SHA256, SHA384, SHA512	Crypto Suite	160, 256, 384,512	[FIPS 180-4] [FIPS 198-1]
Confidentiality	RSAEP RSA encryption	Crypto Suite	1024- 4224	[PKCS#1], 5.1.1
Confidentiality	RSADP RSA decryption with exponential representation	Crypto Suite	1024- 2112	[PKCS#1], 5.1.2, 2a
Confidentiality	RSADP RSA decryption with CRT representation	Crypto Suite	1024- 4224	[PKCS#1], 5.1.2, 2b
Integrity	RSA signature generation RSASP1	Crypto Suite	1024- 4224	[PKCS#1], 5.2.1, 2b
Integrity	RSA signature verification RSAVP1	Crypto Suite	1024- 4224	[PKCS#1], 5.2.2
Key generation	generate probably random primes p and q for RSA keys	Crypto Suite	512- 2064 ¹	[FIPS 186-4], B.3.3 w/o step 1 ² [FIPS 186-5], ch. A.1.3 w/o Step 1 ³

 $^{^{\}rm 1}$ Size for each prime used in the RSA key. This means, the resulting RSA key can have size 1024 - 4128 bits.

² Prime generation is only conformant to [FIPS 186-4], B.3.3 for prime Bitlength >= 1024; in case prime Bitlength < 1024 identical algorithm is used, but considered proprietary

³ Prime generation is only conformant to [FIPS 186-5], A.1.3 for prime Bitlength >= 2048; in case prime Bitlength < 2048 identical algorithm is used, but considered proprietary

Cryptographic Table

Purpose	Cryptographic operation	Implement.	Key size in bits	Standards
Key generation	generate RSA (N, d) parameters from p, q	Crypto Suite	1024- 2112	[FIPS 186-4], B.3.1 [FIPS 186-5], A.1.1 [PKCS#1], 3.1, 3.2(1)
Key generation	generate RSA CRT parameters from p, q	Crypto Suite	1024- 4224	[FIPS 186-4], B.3.1 [FIPS 186-5], A.1.1 [PKCS#1], 3.1, 3.2(2)
Primality test	Miller-Rabin primality test	Crypto Suite	512- 2064 ¹	[FIPS 186-4], C.3.1 [FIPS 186-5], B.3.1
Primality test	Enhanced Miller-Rabin primality test	Crypto Suite	512- 2064 ¹	[FIPS 186-4], C.3.2 [FIPS 186-5], B.3.2
Integrity	ECDSA signature generation	Crypto Suite	160-521	[FIPS 186-4], 6.4 [FIPS 186-5], 6.4.1
Integrity	ECDSA signature verifications	Crypto Suite	160-521	[FIPS 186-4], 6.4 [FIPS 186-5], 6.4.2
Key agreement	ECDH key agreement	Crypto Suite	160-521	[SP 800-56A], 5.7.1.2
Key generation	ECC key generation	Crypto Suite	160-521	[FIPS 186-4], B.4.1 [FIPS 186-5], A.2.1
Authenticated encryption	AES CCM	Flash Loader	128	[SP 800-38C]
Key agreement	Finite Field Diffie-Hellman	Crypto Suite	1024- 2048	[PKCS#3], ch. 7.2
Key derivation	KDF in counter mode with AES CMAC as PRF	Flash Loader	128	[SP 800-108], ch. 4.1 [SP 800-38B], ch. 6.2
Integrity	AES CMAC mode	Flash Loader	128	[FIPS 197] [SP 800-38B]
Hash	SHA-1 Hash digest	Crypto Suite	N/A	[FIPS 180-4]
Hash	SHA-2 Hash digest 224, 256, 384, 512, 512/224, 512/256 bits	Crypto Suite	N/A	[FIPS 180-4]
Authenticated encryption	Ascon authenticated encryption	Crypto Suite	128	[ASCON]
Random	Physical RNG PTG.2	Hardware	N/A	[AIS 31]
Random	Hybrid Physical RNG PTG.3	Crypto Suite	N/A	[AIS 31] [SP 800-90A]
Random	Deterministic RNG DRG.3	Crypto Suite	N/A	[AIS 20], [SP 800-90A]
Random	Hybrid Deterministic RNG DRG.4	Crypto Suite	N/A	[AIS 31] [SP 800-90A]

IMPORTANT NOTICE

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics ("Beschaffenheitsgarantie").

With respect to any examples, hints or any typical values stated herein and/or any information regarding the application of the product, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation warranties of non-infringement of intellectual property rights of any third party.

In addition, any information given in this document is subject to customer's compliance with its obligations stated in this document and any applicable legal requirements, norms and standards concerning customer's products and any use of the product of Infineon Technologies in customer's applications.

The data contained in this document is exclusively intended for technically trained staff. It is the responsibility of customer's technical departments to evaluate the suitability of the product for the intended application and the completeness of the product information given in this document with respect to such application.

For further information on the product, technology delivery terms and conditions and prices please contact your nearest Infineon Technologies office (www.infineon.com).

WARNINGS

Due to technical requirements products may contair dangerous substances. For information on the types in question please contact your nearest Infineor Technologies office.

Except as otherwise explicitly approved by Infineor Technologies in a written document signed by authorized representatives of Infineor Technologies, Infineon Technologies' products may not be used in any applications where a failure of the product or any consequences of the use thereof car reasonably be expected to result in personal injury.
