ST31G480 C02 platform Security Target for composition

Common Criteria for IT security evaluation

1 Introduction (ASE_INT)

1.1 Security Target reference

- 1 Document identification: ST31G480 C02 including optional cryptographic library NesLib, and optional technologies MIFARE® DESFire® EV1 and MIFARE Plus® X SECURITY TARGET FOR COMPOSITION.
- 2 Version number: Rev C02.2, issued in April 2018.
- 3 Registration: registered at ST Microelectronics under number SMD_ST31G480_ST_17_003.

1.2 TOE reference

- 4 This document presents **the Security Target (ST)** of the **ST31G480 C02** Security Integrated Circuit (IC), designed on the **ST31 platform of STMicroelectronics**, with firmware version 2.1.0, optional cryptographic library **NesLib 4.2.10 or 5.2.0**, optional technology **MIFARE® DESFire® EV1^(a) 4.8.12**, and optional technology **MIFARE Plus® X^(b) 2.4.6**.
- 5 The precise reference of the Target of Evaluation (TOE) is given in [Section 1.4: TOE identification](#) and the security IC features are given in [Section 1.6: TOE description](#).
- 6 A glossary of terms and abbreviations used in this document is given in [Appendix A: Glossary](#).

a. MIFARE DESFire are registered trademarks of NXP B.V. and are used under license.

b. MIFARE and MIFARE Plus are registered trademarks of NXP B.V. and are used under license.

4.3.29	Organisational security policy "Un-traceability of end-users for DESFire" ..	51

4.3.30	Organisational security policy "Treatment of user data"	52
5	Security requirements (ASE_REQ)	53
5.1	Security functional requirements for the TOE	53
5.1.1	Security Functional Requirements from the Protection Profile	58
5.1.2	Additional Security Functional Requirements for the cryptographic services	60
5.1.3	Additional Security Functional Requirements for the memories protection	64
5.1.4	Additional Security Functional Requirements related to the possible availability of final test and loading capabilities in phases 4 to 6 of the TOE life-cycle	65
5.1.5	Additional Security Functional Requirements related to MFPlus	67
5.1.6	Additional Security Functional Requirements related to DESFire	72
5.1.7	Additional Security Functional Requirements common to DESFire and MFPlus	78
5.2	TOE security assurance requirements	79
5.3	Refinement of the security assurance requirements	80
5.3.1	Refinement regarding functional specification (ADV_FSP)	81
5.3.2	Refinement regarding test coverage (ATE_COV)	82
5.4	Security Requirements rationale	82
5.4.1	Rationale for the Security Functional Requirements	82
5.4.2	Additional security objectives are suitably addressed	87
5.4.3	Additional security requirements are consistent	93
5.4.4	Dependencies of Security Functional Requirements	96
5.4.5	Rationale for the Assurance Requirements	102
6	TOE summary specification (ASE_TSS)	103
6.1	Limited fault tolerance (FRU_FLT.2)	103
6.2	Failure with preservation of secure state (FPT_FLS.1)	103
6.3	Limited capabilities (FMT_LIM.1) / Test	103
6.4	Limited capabilities (FMT_LIM.1) / Loader	103
6.5	Limited availability (FMT_LIM.2) / Test & (FMT_LIM.2) / Loader	104
6.6	Stored data confidentiality (FDP_SDC.1)	104
6.7	Stored data integrity monitoring and action (FDP_SDI.2)	104
6.8	Audit storage (FAU_SAS.1)	104
6.9	Resistance to physical attack (FPT_PHP.3)	104

6.10	Basic internal transfer protection (FDP_ITT.1), Basic internal TSF data transfer protection (FPT_ITT.1) & Subset information flow control (FDP_IFC.1)	104
6.11	Random number generation (FCS_RNG.1)	105
6.12	Cryptographic operation: TDES operation (FCS_COP.1) / TDES	105
6.13	Cryptographic operation: AES operation (FCS_COP.1) / AES	105
6.14	Cryptographic operation: RSA operation (FCS_COP.1) / RSA if NesLib only	105
6.15	Cryptographic operation: Elliptic Curves Cryptography operation (FCS_COP.1) / ECC if NesLib only	106
6.16	Cryptographic operation: SHA operation (FCS_COP.1) / SHA, if NesLib only	106
6.17	Cryptographic operation: DRBG operation (FCS_COP.1) / DRBG, if NesLib only	106
6.18	Cryptographic operation: Keccak operation (FCS_COP.1) / Keccak, if NesLib 5.2 only	107
6.19	Cryptographic operation: Keccak-p operation (FCS_COP.1) / Keccak-p, if NesLib 5.2 only	107
6.20	Cryptographic operation: Diffie-Hellman operation (FCS_COP.1) / Diffie-Hellman, if NesLib 5.2 only	108
6.21	Cryptographic key generation: Prime generation (FCS_CKM.1) / Prime_generation, if NesLib only	108
6.22	Cryptographic key generation: RSA key generation (FCS_CKM.1) / RSA_key_generation, if NesLib only	108
6.23	Static attribute initialisation (FMT_MSA.3) / Memories	108
6.24	Management of security attributes (FMT_MSA.1) / Memories & Specification of management functions (FMT_SMF.1) / Memories	108
6.25	Complete access control (FDP_ACC.2) / Memories & Security attribute based access control (FDP_ACF.1) / Memories	108
6.26	Static attribute initialisation (FMT_MSA.3) / Loader	108
6.27	Management of security attributes (FMT_MSA.1) / Loader & Specification of management functions (FMT_SMF.1) / Loader	109
6.28	Subset access control (FDP_ACC.1) / Loader, Security attribute based access control (FDP_ACF.1) / Loader, Security roles (FMT_SMR.1) / Loader & Timing of identification (FIA_UID.1) / Loader	109
6.29	Import of user data without security attributes (FDP_ITC.1) / Loader . .	109
6.30	Security roles (FMT_SMR.1) / MFPlus	109
6.31	Subset access control (FDP_ACC.1) / MFPlus	109

6.32	Security attribute based access control (FDP_ACF.1) / MFPlus	110
6.33	Static attribute initialisation (FMT_MSA.3) / MFPlus	110
6.34	Management of security attributes (FMT_MSA.1) / MFPlus	110
6.35	Specification of Management Functions (FMT_SMF.1) / MFPlus	110
6.36	Import of user data with security attributes (FDP_ITC.2) / MFPlus	110
6.37	Inter-TSF basic TSF data consistency (FPT_TDC.1) / MFPlus	110
6.38	Cryptographic key destruction (FCS_CKM.4) / MFPlus	110
6.39	User identification before any action (FIA_UID.2) / MFPlus	110
6.40	User authentication before any action (FIA_UAU.2) / MFPlus	111
6.41	Multiple authentication mechanisms (FIA_UAU.5) / MFPlus	111
6.42	Management of TSF data (FMT_MTD.1) / MFPlus	111
6.43	Trusted path (FTP_TRP.1) / MFPlus	111
6.44	Replay detection (FPT_RPL.1) / MFPlus	111
6.45	Unlinkability (FPR_UNL.1) / MFPlus	111
6.46	Minimum and maximum quotas (FRU_RSA.2) / MFPlus	111
6.47	Subset residual information protection (FDP_RIP.1) / MFPlus	111
6.48	Security roles (FMT_SMR.1) / DESFire	112
6.49	Subset access control (FDP_ACC.1) / DESFire	112
6.50	Security attribute based access control (FDP_ACF.1) / DESFire	112
6.51	Static attribute initialisation (FMT_MSA.3) / DESFire	112
6.52	Management of security attributes (FMT_MSA.1) / DESFire	112
6.53	Specification of Management Functions (FMT_SMF.1) / DESFire	112
6.54	Import of user data with security attributes (FDP_ITC.2) / DESFire	112
6.55	Inter-TSF basic TSF data consistency (FPT_TDC.1) / DESFire	113
6.56	Cryptographic key destruction (FCS_CKM.4) / DESFire	113
6.57	User identification before any action (FIA_UID.2) / DESFire	113
6.58	User authentication before any action (FIA_UAU.2) / DESFire	113
6.59	Multiple authentication mechanisms (FIA_UAU.5) / DESFire	113
6.60	Management of TSF data (FMT_MTD.1) / DESFire	113
6.61	Trusted path (FTP_TRP.1) / DESFire	113
6.62	Basic rollback (FDP_ROL.1) / DESFire	113
6.63	Replay detection (FPT_RPL.1) / DESFire	114
6.64	Unlinkability (FPR_UNL.1) / DESFire	114

6.65	Minimum and maximum quotas (FRU_RSA.2) / DESFire	114
6.66	Subset residual information protection (FDP_RIP.1) / DESFire	114
6.67	Subset access control (FDP_ACC.1) / APPLI_FWL & Security attribute based access control (FDP_ACF.1) / APPLI_FWL	114
6.68	Static attribute initialisation (FMT_MSA.3) / APPLI_FWL	114

1.3 Context

- 7 The Target of Evaluation (TOE) referred to in [Section 1.4: TOE identification](#), is evaluated under the French IT Security Evaluation and Certification Scheme and is developed by the Secure Microcontrollers Division of STMicroelectronics (ST).
- 8 The assurance level of the performed Common Criteria (CC) IT Security Evaluation is EAL5 augmented by ADV_IMP.2, ADV_INT.3, ADV_TDS.5, ALC_CMC.5, ALC_DVS.2, ALC_FLR.1, ALC_TAT.3, ASE_TSS.2, ATE_COV.3, ATE_FUN.2 and AVA_VAN.5.
- 9 The intent of this Security Target is to specify the Security Functional Requirements (SFRs) and Security Assurance Requirements (SARs) applicable to the TOE security ICs, and to summarise their chosen TSF services and assurance measures.
- 10 This ST claims to be an instantiation of the "[Eurosmart - Security IC Platform Protection Profile with Augmentation Packages](#)" (PP) registered and certified under the reference [BSI-CC-PP-0084-2014](#) in the German IT Security Evaluation and Certification Scheme, **with the following augmentations**:
- Addition #1: "Support of Cipher Schemes" from [AUG](#)
 - Addition #4: "Area based Memory Access Control" from [AUG](#)
 - Additions specific to this Security Target.
- The original text of this PP is typeset as [indicated here](#), its augmentations from [AUG](#) as [indicated here](#), when they are reproduced in this document.
- This ST also instantiates the following package from the above mentioned PP:
- Loader dedicated for usage in secured environment only.
- 11 Extensions introduced in this ST to the SFRs of the Protection Profile (PP) are **exclusively** drawn from the Common Criteria part 2 standard SFRs.
- 12 This ST makes various refinements to the above mentioned PP and [AUG](#). They are all properly identified in the text typeset as **indicated here**. The original text of the PP is repeated as scarcely as possible in this document for reading convenience. All PP identifiers have been however prefixed by their respective origin label: **BSI** for [BSI-CC-PP-0084-2014](#), **AUG1** for Addition #1 of [AUG](#) and **AUG4** for Addition #4 of [AUG](#).

1.4 TOE identification

- 13 The Target of Evaluation (TOE) is the ST31G480 C02 platform.
- 14 "ST31G480 C02" completely identifies the TOE including its components listed in [Table 1: TOE components](#), its guidance documentation detailed in [Table 15: Guidance documentation](#), and its development and production sites indicated in [Table 16: Sites list](#).
- 15 C02 is the version of the evaluated platform. Any change in the TOE components, the guidance documentation and the list of sites leads to a new version of the evaluated platform, thus a new TOE.

Table 1. TOE components

IC Maskset name	IC version	Master identification number ⁽¹⁾	Firmware version	OST version	Optional NesLib crypto library version	Optional MIFARE DESFire EV1 version	Optional MIFARE Plus X version
K8L0B	H	00B8h	2.1.0	3.4	4.2.10 or 5.2.0	4.8.12	2.4.6

1. Part of the product information.

- 16 The IC maskset name is the product hardware identification.
The IC version is updated for any change in hardware (i.e. part of the layers of the maskset) or in the OST software.
- 17 All along the product life, the marking on the die, a set of accessible registers and a set of specific instructions allow the customer to check the product information, providing the identification elements, as listed in [Table 1: TOE components](#), and the configuration elements as detailed in the Data Sheet, referenced in [Table 15: Guidance documentation](#).
- 18 In this Security Target, the term "DESFire" means MIFARE® DESFire® EV1 4.8.12.
- 19 In this Security Target, the term "MFPlus" means MIFARE Plus® X 2.4.6.

1.5 TOE overview

- 20 Designed for secure ID and banking applications, the TOE is a serial access microcontroller that incorporates the most recent generation of ARM® processors for embedded secure systems. Its SecurCore® SC000™ 32-bit RISC core is built on the Cortex™ M0 core with additional security features to help to protect against advanced forms of attacks.
- 21 Different derivative devices may be configured depending on the customer needs:
- either by ST during the manufacturing or packaging process,
 - or by the customer during the packaging, or composite product integration, or personnalisation process.
- 22 They all share the same hardware design and the same maskset (denoted by the Master identification number). The Master identification number is unique for all product configurations.
- 23 The configuration of the derivative devices can impact the I/O mode, the available NVM size, the availability of Nescrypt and the availability of MIFARE support features, as detailed here below:

Table 2. Derivative devices configuration possibilities

Features	Possible values
I/O mode	Contact only, Dual mode, Contactless only
NVM size	128, 192, 256, 320, 384, 448 or 480 Kbytes
Nescrypt	Active, Inactive

Table 2. Derivative devices configuration possibilities (continued)

Features	Possible values
MIFARE support (Crypto1 + LPU)	Active, Inactive
Capacitor	20pF, 68pF, 168pF

- 24 All combinations of different features values are possible and covered by this certification. All possible configurations can vary under a unique IC, and without impact on security.
- 25 The Master identification number is unique for all product configurations. Each derivative device has a specific Child product identification number, also part of the product information, and specified in the Data Sheet and in the Firmware User Manual, referenced in [Table 15](#).
- 26 The rest of this document applies to all possible configurations of the TOE, with or without NesLib, or MIFARE libraries, except when a restriction is mentioned. For easier reading, the restrictions are typeset as [indicated here](#).
- 27 In a few words, the ST31G480 C02 offers a unique combination of high performances and very powerful features for high level security:
- Die integrity,
 - Monitoring of environmental parameters,
 - Protection mechanisms against faults,
 - AIS20/AIS31 class PTG.2 compliant True Random Number Generator,
 - Hardware Security Enhanced DES accelerator,
 - Hardware Security AES accelerator,
 - ISO 3309 CRC calculation block,
 - Memory Protection Unit,
 - optional NExt Step CRYPTography accelerator (NESCRIPT),
 - optional cryptographic library,
 - optional MIFARE support,
 - optional secure MIFARE® DESFire® EV1 library,
 - optional secure MIFARE Plus® X library.

1.6 TOE description

1.6.1 TOE hardware description

- 28 The TOE features hardware accelerators for advanced cryptographic functions, with built-in countermeasures against side channel attacks. The AES (Advanced Encryption Standard) accelerator provides a high-performance implementation of AES-128, AES-192 and AES-256 algorithms. The 3-key triple DES accelerator (EDES+) supports efficiently the Data Encryption Standard (TDES [\[2\]](#)), enabling Cipher Block Chaining (CBC) mode and triple DES computation. If [Nescrypt is active](#), the NESCRIPT crypto-processor allows fast and secure implementation of the most popular public key cryptosystems with a high level of performance ([\[7\]](#), [\[9\]](#), [\[12\]](#), [\[13\]](#), [\[14\]](#), [\[15\]](#)).

- 29 The TOE offers 12 Kbytes of User RAM and up to 480 Kbytes of secure User high-density Flash memory (NVM).
- 30 As randomness is a key stone in many applications, the ST31G480 C02 features a highly reliable True Random Number Generator (TRNG), compliant with PTG.2 Class of AIS20/AIS31 [1] and directly accessible thru dedicated registers.
- 31 This device also includes the ARM® SecurCore® SC000™ memory protection unit (MPU), which enables the user to define its own region organization with specific protection and access permissions.
- 32 The TOE offers a contact serial communication interface fully compatible with the ISO/IEC 7816-3 standard, and a contactless interface including an RF Universal Asynchronous Receiver Transmitter (RF UART), enabling communication up to 848 Kbits/s compatible with the ISO/IEC 14443 Type A, B and B', PayPass™ and ISO/IEC 18092 passive mode standards.
These interfaces can be used simultaneously (dual mode), or the contact interface can be deactivated (see [Table 2: Derivative devices configuration possibilities](#)).
- 33 The detailed features of this TOE are described in the Data Sheet and in the Cortex SC000 Technical Reference Manual, referenced in [Table 15](#).
- 34 [Figure 1](#) provides an overview of the ST31G480 C02 platform.

Figure 1. ST31G480 C02 platform block diagram

1.6.2 TOE software description

- 35 The OST ROM contains a Dedicated Software which provides full test capabilities (operating system for test, called "OST"), not accessible by the Security IC Embedded Software (ES), after TOE delivery.

- 36 The System ROM and ST NVM of the TOE contain a Dedicated Software which provides a very reduced set of commands for final test (operating system for final test, called "FTOS"), not intended for the Security IC Embedded Software (ES) usage, and not available in User configuration.
- 37 The System ROM and ST NVM of the TOE contain a Dedicated Support Software called Secure Flash Loader, enabling to securely and efficiently download the Security IC Embedded Software (ES) into the NVM. It also allows the evaluator to load software into the TOE for test purpose. The Secure Flash Loader is not available in User configuration.
- 38 The System ROM and ST NVM of the TOE contain a Dedicated Support Software, which provides low-level functions (called Flash Drivers), enabling the Security IC Embedded Software (ES) to modify and manage the NVM contents. The Flash Drivers are available all through the product life-cycle.
- 39 The TOE optionally comprises a specific application in User NVM: this applicative Embedded Software is a cryptographic library called NesLib. NesLib is a cutting edge cryptographic library in terms of security and performance.

NesLib is embedded by the ES developer in his applicative code.

Note that the NesLib RSA, ECC and Diffie-Hellman functions can only be used if [Nescrypt is active](#).

NesLib is a cryptographic toolbox supporting the most common standards and protocols:

- an asymmetric key cryptographic support module, supporting secure modular arithmetic with large integers, with specialized functions for Rivest, Shamir & Adleman Standard cryptographic algorithm (RSA [\[14\]](#)), and in [NesLib 5.2](#) only, Diffie-Hellman [\[21\]](#),
- an asymmetric key cryptographic support module that provides very efficient basic functions to build up protocols using Elliptic Curves Cryptography on prime fields GF(p) with elliptic curves in short Weierstrass form [\[12\]](#), and provides support for ECDH key agreement [\[19\]](#) and ECDSA generation and verification [\[5\]](#).
- a cryptographic support module that provides secure hash functions (SHA-1^(a), SHA-2 [\[4\]](#)), and in [NesLib 5.2](#) only, Keccak and Keccak-p [\[23\]](#),
- in [NesLib 5.2](#) only, a symmetric key cryptographic support module whose base algorithm is the Data Encryption Standard cryptographic algorithm (DES) [\[2\]](#),
- in [NesLib 5.2](#) only, a symmetric key cryptographic support module whose base algorithm is the Advanced Encryption Standard cryptographic algorithm (AES) [\[6\]](#),
- support for Deterministic Random Bit Generators [\[17\]](#),
- prime number generation and RSA key pairs generation [\[3\]](#).

- 40 The TOE optionally comprises a specific application in User NVM: this applicative Embedded Software is a MIFARE technology library.
This library may be a secure library called MIFARE® DESFire® EV1. DESFire features a mutual three pass authentication, a data encryption on RF channel, and a flexible self-securing file system.
This library may be a secure library called MIFARE Plus® X. MFPlus features AES authentication, data encryption on RF channel, potential for multiple instances of the file system consisting of 16byte blocks arranged into sectors with each sector having its own

a. Note that SHA-1 is no longer recommended as a cryptographic function in the context of smart card applications. Hence, Security IC Embedded Software may need to use another SHA to achieve a suitable strength.

access control keys and conditions. Note that MIFARE Plus® S is a sub-configuration of MIFARE Plus® X, and is evaluated as such.

DESFire or MFPlus is embedded on the TOE by ST.

DESFire and MFPlus do not coexist on the TOE.

Note that DESFire and MFPlus can only be used if **MIFARE support is active**.

- 41 In MFPlus, the card is in one (of in total four) security levels. The main features of each security level are listed below:
- Security level 0: The card does not provide any functionality besides initialization. The card is initialized in plaintext, especially keys for the further levels can be brought in. A card in security level 0 is not usable for other purposes. After all mandatory keys and security attributes have been stored in the card, it can be switched to security level 1.
 - Security level 1: The card user can access the blocks in the card after an authentication procedure. The communication with the terminal is protected, however the authentication and the protected communication in the security level are not evaluated security services of the TOE. It can be switched to security level 3 if an authentication using the AES algorithm with the necessary key is performed.
 - Security level 2: The card user can access the blocks in the card after an authentication procedure involving an authentication using the AES algorithm and an authentication using a proprietary algorithm. The communication with the terminal is protected, however both authentications and the protected communication in this security level are not evaluated security services of the TOE. The TOE can be switched to security level 3 if an authentication using the AES algorithm with the necessary key is performed.
 - Security level 3: The card user can access the data blocks in the card via an adequate card terminal after an authentication procedure based on the AES algorithm. The communication with the card terminal can be protected by using a message authentication code (MAC). The authentication and the MAC are security services of the TOE. The TOE cannot be switched to a different security level.
- 42 The Security levels 0, 1 and 2 are outside the scope of this evaluation. Thus, MFPlus must be in Security level 3 on the field (Phase 7).
In all security levels, the TOE does additionally support the so-called originality function which allows verifying the authenticity of the TOE.
- 43 In MFPlus, the TOE supports the virtual card architecture by providing a selection mechanism for virtual cards. This allows using the TOE in a complex environment where multiple virtual cards are stored in one physical object, however the TOE does support only one virtual card.
- 44 The Security IC Embedded Software (ES) is in User NVM.

Note: The ES is not part of the TOE and is out of scope of the evaluation, except NesLib, MIFARE DESFire EV1, and MIFARE Plus X when they are embedded.

1.6.3 TOE documentation

45 The user guidance documentation, part of the TOE, consists of:

- the product Data Sheet and die description,
- the product family Security Guidance,
- the AIS31 user manuals,
- the product family programming manual,
- the ARM SC000 Technical Reference Manual,
- the Firmware user manual,
- the Flash loader installation guide,
- optionally the NesLib user manual,
- optionally the MIFARE DESFire EV1 user manual,
- optionally the MIFARE Plus X user manual.

46 The complete list of guidance documents is detailed in [Table 15](#).

1.7 TOE life cycle

47 This Security Target is fully conform to the claimed PP. In the following, just a summary and some useful explanations are given. For complete details on the TOE life cycle, please refer to the [Eurosmart - Security IC Platform Protection Profile with Augmentation Packages \(BSI-CC-PP-0084-2014\)](#), section 1.2.3.

48 The composite product life cycle is decomposed into 7 phases. Each of these phases has the very same boundaries as those defined in the claimed protection profile.

49 The life cycle phases are summarized in [Table 3](#).

50 The sites potentially involved in the TOE life cycle are listed in [Table 16](#).

51 The limit of the evaluation corresponds to phases 2, 3 and optionally 4, including the delivery and verification procedures of phase 1, and the TOE delivery either to the IC packaging manufacturer or to the composite product integrator ; procedures corresponding to phases 1, 5, 6 and 7 are outside the scope of this evaluation.

52 In the following, the term "Composite product manufacturing" is uniquely used to indicate phases 1, optionally 4, 5 and 6 all together.

This ST also uses the term "Composite product manufacturer" which includes all roles responsible of the TOE during phases 1, optionally 4, 5 and 6.

53 The TOE is delivered after Phase 3 in form of wafers or after Phase 4 in packaged form, depending on the customer's order.

54 In the following, the term "TOE delivery" is uniquely used to indicate:

- after Phase 3 (or before Phase 4) if the TOE is delivered in form of wafers or sawn wafers (dice) or
- after Phase 4 (or before Phase 5) if the TOE is delivered in form of packaged products.

55 The TOE is delivered in Admin (aka Issuer) or User configuration.

Table 3. Composite product life cycle phases

Phase	Name	Description
1	Security IC embedded software development	security IC embedded software development specification of IC pre-personalization requirements
2	IC development	IC design IC dedicated software development
3	IC manufacturing and testing	integration and photomask fabrication IC manufacturing IC testing IC pre-personalisation
4	IC packaging	security IC packaging (and testing) pre-personalisation if necessary
5	Security IC product finishing process	composite product finishing process composite product testing
6	Security IC personalisation	composite product personalisation composite product testing
7	Security IC end usage	composite product usage by its issuers and consumers

1.8 TOE environment

56 Considering the TOE, three types of environments are defined:

- Development environment corresponding to phase 2,
- Production environment corresponding to phase 3 and optionally 4,
- Operational environment, including phase 1 and from phase 4 or 5 to phase 7.

1.8.1 TOE Development Environment

57 To ensure security, the environment in which the development takes place is secured with controllable accesses having traceability. Furthermore, all authorised personnel involved fully understand the importance and the strict implementation of defined security procedures.

58 The development begins with the TOE's specification. All parties in contact with sensitive information are required to abide by Non-Disclosure Agreements.

59 Design and development of the IC then follows, together with the dedicated and engineering software and tools development. The engineers use secure computer systems (preventing unauthorised access) to make their developments, simulations, verifications and generation of the TOE's databases. Sensitive documents, files and tools, databases on tapes, and printed circuit layout information are stored in appropriate locked cupboards/safe. Of paramount importance also is the disposal of unwanted data (complete electronic erasures) and documents (e.g. shredding).

60 The development centres possibly involved in the development of the TOE are denoted by the activity "DEV" in [Table 16](#).

- 61 Reticules and photomasks are generated from the verified IC databases; the former are used in the silicon Wafer-fab processing. As reticules and photomasks are generated off-site, they are transported and worked on in a secure environment. During the transfer of sensitive data electronically, procedures are established to ensure that the data arrive only at the destination and are not accessible at intermediate stages (e.g. stored on a buffer server where system administrators make backup copies).
- 62 The authorized sub-contractors potentially involved in the TOE mask manufacturing are denoted by the activity "MASK" in [Table 16](#).

1.8.2 TOE production environment

- 63 As high volumes of product commonly go through such environments, adequate control procedures are necessary to account for all product at all stages of production.
- 64 Production starts within the Wafer-fab; here the silicon wafers undergo the diffusion processing. Computer tracking at wafer level throughout the process is commonplace. The wafers are then taken into the test area. Testing of each TOE occurs to assure conformance with the device specification.
- 65 The authorized front-end plant possibly involved in the manufacturing of the TOE are denoted by the activity "FE" in [Table 16](#).
- 66 The authorized EWS plant potentially involved in the testing of the TOE are denoted by the activity "EWS" in [Table 16](#).
- 67 Wafers are then scribed and broken such as to separate the functional from the non-functional ICs. The latter is discarded in a controlled accountable manner. The good ICs are then packaged in phase 4, in a back-end plant. When testing, programming or deliveries are done offsite, ICs are transported and worked on in a secure environment with accountability and traceability of all (good and bad) products.
- 68 When the product is delivered after phase 4, the authorized back-end plants possibly involved in the packaging of the TOE are denoted by the activity "BE" in [Table 16](#).
- 69 All sites are denoted by the activity "WHS" in [Table 16](#) can be involved for the logistics.

1.8.3 TOE operational environment

- 70 A TOE operational environment is the environment of phases 1, optionally 4, then 5 to 7.
- 71 At phases 1, 4, 5 and 6, the TOE operational environment is a controlled environment.
- 72 End-user environments (phase 7): composite products are used in a wide range of applications to assure authorised conditional access. Examples of such are pay-TV, banking cards, brand protection, portable communication SIM cards, health cards, transportation cards, access management, identity and passport cards. The end-user environment therefore covers a wide range of very different functions, thus making it difficult to avoid and monitor any abuse of the TOE.

2 Conformance claims (ASE_CCL, ASE_ECD)

2.1 Common Criteria conformance claims

- 73 The ST31G480 C02 platform Security Target claims to be conformant to the Common Criteria version 3.1 revision 4.
- 74 Furthermore it claims to be CC Part 2 ([CCMB-2012-09-002 R4](#)) extended and CC Part 3 ([CCMB-2012-09-003 R4](#)) conformant.
- 75 The extended Security Functional Requirements are those defined in the [Eurosmart - Security IC Platform Protection Profile with Augmentation Packages \(BSI-CC-PP-0084-2014\)](#):
- **FCS_RNG** Generation of random numbers,
 - **FMT_LIM** Limited capabilities and availability,
 - **FAU_SAS** Audit data storage,
 - **FDP_SDC** Stored data confidentiality.
- The reader can find their certified definitions in the text of the "[BSI-CC-PP-0084-2014](#)" Protection Profile.
- 76 The assurance level for the ST31G480 C02 platform Security Target is **EA15** augmented by ADV_IMP.2, ADV_INT.3, ADV_TDS.5, ALC_CMC.5, ALC_DVS.2, ALC_FLR.1, ALC_TAT.3, ASE_TSS.2, ATE_COV.3, ATE_FUN.2 and AVA_VAN.5.

2.2 PP Claims

2.2.1 PP Reference

- 77 The ST31G480 C02 platform Security Target claims strict conformance to the [Eurosmart - Security IC Platform Protection Profile with Augmentation Packages \(BSI-CC-PP-0084-2014\)](#), for the part of the TOE covered by this PP (Security IC), as required by this Protection Profile.

2.2.2 PP Additions

- 78 The main additions operated on the [BSI-CC-PP-0084-2014](#) are:
- Addition #4: "Area based Memory Access Control" from [AUG](#),
 - Addition #1: "Support of Cipher Schemes" from [AUG](#),
 - Specific additions for the Secure Flash Loader
 - Specific additions for DESFire and MFPlus,
 - Refinement of assurance requirements.
- 79 All refinements are indicated with type setting text **as indicated here**, original text from the [BSI-CC-PP-0084-2014](#) being typeset **as indicated here**. Text originating in [AUG](#) is typeset **as indicated here**.
- 80 The security environment additions relative to the PP are summarized in [Table 4](#).
- 81 The additional security objectives relative to the PP are summarized in [Table 5](#).
- 82 A simplified presentation of the TOE Security Policy (TSP) is added.

83 The additional SFRs for the TOE relative to the PP are summarized in [Table 7](#).

84 The additional SARs relative to the PP are summarized in [Table 10](#).

2.2.3 PP Claims rationale

85 The differences between this Security Target security objectives and requirements and those of [BSI-CC-PP-0084-2014](#), to which conformance is claimed, have been identified and justified in [Section 4](#) and in [Section 5](#). They have been recalled in the previous section.

86 In the following, the statements of the security problem definition, the security objectives, and the security requirements are consistent with those of the [BSI-CC-PP-0084-2014](#).

87 The security problem definition presented in [Section 3](#), clearly shows the additions to the security problem statement of the PP.

88 The security objectives rationale presented in [Section 4.3](#) clearly identifies modifications and additions made to the rationale presented in the [BSI-CC-PP-0084-2014](#).

89 Similarly, the security requirements rationale presented in [Section 5.4](#) has been updated with respect to the protection profile.

90 All PP requirements have been shown to be satisfied in the extended set of requirements whose completeness, consistency and soundness have been argued in the rationale sections of the present document.

3 Security problem definition (ASE_SPD)

- 91 This section describes the security aspects of the environment in which the TOE is intended to be used and addresses the description of the assets to be protected, the threats, the organisational security policies and the assumptions.
- 92 Note that the origin of each security aspect is clearly identified in the prefix of its label. Most of these security aspects can therefore be easily found in the [Eurosmart - Security IC Platform Protection Profile with Augmentation Packages \(BSI-CC-PP-0084-2014\)](#), section 3. Only those originating in [AUG](#), and the ones introduced in this Security Target, are detailed in the following sections.
- 93 A summary of all these security aspects and their respective conditions is provided in [Table 4](#).

94

Table 4. Summary of security aspects

	Label	Title
TOE threats	BSI.T.Leak-Inherent	Inherent Information Leakage
	BSI.T.Phys-Probing	Physical Probing
	BSI.T.Malfunction	Malfunction due to Environmental Stress
	BSI.T.Phys-Manipulation	Physical Manipulation
	BSI.T.Leak-Forced	Forced Information Leakage
	BSI.T.Abuse-Func	Abuse of Functionality
	BSI.T.RND	Deficiency of Random Numbers
	AUG4.T.Mem-Access	Memory Access Violation
	T.Data-Modification-MFPlus	Unauthorised data modification for MFPlus
	T.Impersonate-MFPlus	Impersonating authorised users during authentication for MFPlus
	T.Cloning-MFPlus	Cloning for MFPlus
	T.Confid-Applic-Code-MFPlus	MFPlus code confidentiality
	T.Confid-Applic-Data-MFPlus	MFPlus data confidentiality
	T.Integ-Applic-Code-MFPlus	MFPlus code integrity
	T.Integ-Applic-Data-MFPlus	MFPlus data integrity
	T.Application-Resource-MFPlus	MFPlus resource unavailability
	T.Data-Modification-DESFire	Unauthorised data modification for DESFire
	T.Impersonate-DESFire	Impersonating authorised users during authentication for DESFire
	T.Cloning-DESFire	Cloning for DESFire
	T.Confid-Applic-Code-DESFire	DESFire code confidentiality
	T.Confid-Applic-Data-DESFire	DESFire data confidentiality
	T.Integ-Applic-Code-DESFire	DESFire code integrity
	T.Integ-Applic-Data-DESFire	DESFire data integrity
	T.Resource-DESFire	DESFire resource unavailability

	A.Secure-Values-DESFire	Usage of secure values for DESFire
	A.Terminal-Support-DESFire	Terminal support to ensure integrity and confidentiality for DESFire

3.1 Description of assets

95 Since this Security Target claims strict conformance to the *Eurosmart - Security IC Platform Protection Profile with Augmentation Packages (BSI-CC-PP-0084-2014)*, the assets defined in section 3.1 of the Protection Profile are applied and the assets regarding threats are clarified in this Security Target.

- 96 The assets regarding the threats are:
- logical design data, physical design data, IC Dedicated Software, and configuration data,
 - Initialisation data and pre-personalisation data, specific development aids, test and characterisation related data, material for software development support, and photomasks and product in any form,
 - the TOE correct operation,
 - the Security IC Embedded Software, stored in the TOE's protected memories and in operation,
 - the security services provided by the TOE for the Security IC Embedded Software,
 - the cryptographic co-processors for Triple-DES and AES, the random number generator,
 - when **DESFire** is embedded, the special functions for the communication with an external interface device,
 - the User Data comprising, especially when **DESFire** is embedded,
 - authentication data like keys,
 - issuer data like card holder name or processing options,
 - representation of monetary values, e.g. a stored value for transport applications,
 - the TSF Data.
- 97 This Security Target includes optionally Security IC Embedded Software and therefore does contain more assets compared to [BSI-CC-PP-0084-2014](#). These assets are described above.
- 98 Application note:
The TOE providing a functionality for Security IC Embedded Software secure loading into NVM, the ES is considered as User Data being stored in the TOE's memories at this step, and the Protection Profile security concerns are extended accordingly.

3.2 Threats

- 99 The threats are described in the [BSI-CC-PP-0084-2014](#), section 3.2.
Only those originating in **AUG** and those related to DESFire and MFPlus are detailed in the following section.

BSI.T.Leak-Inherent	Inherent Information Leakage
BSI.T.Phys-Probing	Physical Probing
BSI.T.Malfunction	Malfunction due to Environmental Stress
BSI.T.Phys-Manipulation	Physical Manipulation
BSI.T.Leak-Forced	Forced Information Leakage
BSI.T.Abuse-Func	Abuse of Functionality
BSI.T.RND	Deficiency of Random Numbers

AUG4.T.Mem-Access Memory Access Violation:

Parts of the **Security IC** Embedded Software may cause security violations by accidentally or deliberately accessing restricted data (which may include code). Any restrictions are defined by the security policy of the specific application context and must be implemented by the **Security IC** Embedded Software.

Clarification: This threat does not address the proper definition and management of the security rules implemented by the Security IC Embedded Software, this being a software design and correctness issue. This threat addresses the reliability of the abstract machine targeted by the software implementation. To avert the threat, the set of access rules provided by this TOE should be undefeated if operated according to the provided guidance. The threat is not realized if the Security IC Embedded Software is designed or implemented to grant access to restricted information. It is realized if an implemented access denial is granted under unexpected conditions or if the execution machinery does not effectively control a controlled access.

Here the attacker is expected to (i) take advantage of flaws in the design and/or the implementation of the TOE memory access rules (refer to BSI.T.Abuse-Func but for functions available after TOE delivery), (ii) introduce flaws by forcing operational conditions (refer to BSI.T.Malfunction) and/or by physical manipulation (refer to BSI.T.Phys-Manipulation). This attacker is expected to have a high level potential of attack.

100 The following additional threats are related to MFPlus. They are valid in case MFPlus is embedded in the TOE.

T.Data-Modification-MFPlus

Unauthorised data modification for MFPlus:

User data stored by the TOE may be modified by unauthorised subjects. This threat applies to the processing of modification commands received by the TOE, it is not concerned with verification of authenticity.

T.Impersonate-MFPlus

Impersonating authorised users during authentication for MFPlus:

An unauthorised subject may try to impersonate an authorised subject during the authentication sequence, e.g. by a man-in-the middle or replay attack.

T.Cloning-MFPlus

Cloning for MFPlus:

All data stored on the TOE (including keys) may be read out in order to create a duplicate.

T.Confid-Applic-Code-MFPlus

MFPlus code confidentiality:

MIFARE Plus Licensed product code must be protected against unauthorized disclosure. This relates to attacks at runtime to gain read or compare access to memory area where the MIFARE Plus licensed product executable code is stored. The attacker executes an application to disclose code belonging to MIFARE Plus Licensed product.

T.Confid-Applic-Data-MFPlus	MFPlus data confidentiality: MIFARE Plus Licensed product data must be protected against unauthorized disclosure. This relates to attacks at runtime to gain read or compare access to the MIFARE Plus licensed product data by another application. For example, the attacker executes an application that tries to read data belonging to MIFARE Plus Licensed product.
T.Integ-Applic-Code-MFPlus	MFPlus code integrity: MIFARE Plus Licensed product code must be protected against unauthorized modification. This relates to attacks at runtime to gain write access to memory area where the MIFARE Plus licensed product executable code is stored and executed. The attacker executes an application that tries to alter (part of) the MIFARE Plus Licensed product code.
T.Integ-Applic-Data-MFPlus	MFPlus data integrity: MIFARE Plus Licensed product data must be protected against unauthorized modification. This relates to attacks at runtime to gain write access to the MIFARE Plus Licensed product data by another application. The attacker executes an application that tries to alter (part of) the MIFARE Plus Licensed product data.
T.Application-Resource-MFPlus	MFPlus resource unavailability: The availability of resources for the MIFARE Plus Licensed product shall be controlled to prevent denial of service or malfunction. An attacker prevents correct execution of MIFARE Plus through consumption of some resources of the card: e.g. RAM or non volatile RAM.
101	The following additional threats are related to DESFire. They are valid in case DESFire is embedded in the TOE.
T.Data-Modification-DESFire	Unauthorised data modification for DESFire: User data stored by the TOE may be modified by unauthorised subjects. This threat applies to the processing of modification commands received by the TOE, it is not concerned with verification of authenticity.
T.Impersonate-DESFire	Impersonating authorised users during authentication for DESFire: An unauthorised subject may try to impersonate an authorised subject during the authentication sequence, e.g. by a man-in-the middle or replay attack.
T.Cloning-DESFire	Cloning for DESFire: User and TSF data stored on the TOE (including keys) may be read out by an unauthorised subject in order to create a duplicate.

T.Confid-Applic-Code-DESFire	DESFire code confidentiality: MIFARE DESFire EV1 Licensed product code must be protected against unauthorized disclosure. This relates to attacks at runtime to gain read or compare access to memory area where the MIFARE DESFire EV1 licensed product executable code is stored. The attacker executes an application to disclose code belonging to MIFARE DESFire EV1 Licensed product.
T.Confid-Applic-Data-DESFire	DESFire data confidentiality: MIFARE DESFire EV1 Licensed product data must be protected against unauthorized disclosure. This relates to attacks at runtime to gain read or compare access to the MIFARE DESFire EV1 licensed product data by another application. For example, the attacker executes an application that tries to read data belonging to MIFARE DESFire EV1 Licensed product.
T.Integ-Applic-Code-DESFire	DESFire code integrity: MIFARE DESFire EV1 Licensed product code must be protected against unauthorized modification. This relates to attacks at runtime to gain write access to memory area where the MIFARE DESFire EV1 licensed product executable code is stored. The attacker executes an application that tries to alter (part of) the DESFire EV1 code.
T.Integ-Applic-Data-DESFire	DESFire data integrity: MIFARE DESFire EV1 Licensed product data must be protected against unauthorized modification. This relates to attacks at runtime to gain write access to the MIFARE DESFire EV1 Licensed product data by another application. The attacker executes an application that tries to alter (part of) the DESFire EV1 Licensed product data.
T.Resource-DESFire	DESFire resource unavailability: The availability of resources for the MIFARE DESFire EV1 Licensed product shall be controlled to prevent denial of service or malfunction. An attacker prevents correct execution of DESFire EV1 through consumption of some resources of the card: e.g. RAM or non volatile RAM.

3.3 Organisational security policies

- 102 The TOE provides specific security functionality that can be used by the **Security IC** Embedded Software. In the following specific security functionality is listed which is not derived from threats identified for the TOE's environment because it can only be decided in the context of the **Security IC** application, against which threats the **Security IC** Embedded Software will use the specific security functionality.
- 103 ST applies the Protection policy during TOE Development and Production ([BSI.P.Process-TOE](#)) as specified below.
- 104 [BSI.P.Lim-Block-Loader](#) is dedicated to the Secure Flash Loader, and described in the [BSI-CC-PP-0084-2014](#) package "Loader dedicated for usage in secured environment only".

- 105 **ST** applies the Additional Specific Security Functionality policy ([AUG1.P.Add-Functions](#)) as specified below.
- 106 New Organisational Security Policies (OSPs) are defined here below:
- 107 P.Controlled-ES-Loading is related to the capability provided by the TOE to load Security IC Embedded Software into the NVM after TOE delivery, in a controlled manner, during composite product manufacturing. The use of this capability is optional, and depends on the customer's production organization.
- 108 P.Confidentiality, P.Transaction and P.No-Trace-DESFire are related to [DESFire](#), and valid in case DESFire is embedded in the TOE.
- 109 P.MAC and P.No-Trace-MFPlus are related to [MFPlus](#), and valid in case MFPlus is embedded in the TOE.
- 110 P.Resp-Appl are related to the ES that is part of the evaluation ([NesLib](#) and/or [DESFire](#) and/or [MFPlus](#)), and valid in case NesLib or DESFire or MFPlus are embedded in the TOE.

[BSI.P.Process-TOE](#)

Identification during TOE Development and Production:

An accurate identification **is** established for the TOE. This requires that each instantiation of the TOE carries this unique identification.

[BSI.P.Lim-Block-Loader](#)

Limiting and blocking the loader functionality:

The composite manufacturer uses the Loader for loading of Security IC Embedded Software, user data of the Composite Product or IC Dedicated Support Software in charge of the IC Manufacturer. He limits the capability and blocks the availability of the Loader in order to protect stored data from disclosure and manipulation.

AUG1.P.Add-Functions Additional Specific Security Functionality:

The TOE shall provide the following specific security functionality to the Security IC Embedded Software:

- Triple Data Encryption Standard (TDES),
- Advanced Encryption Standard (AES),
- **Elliptic Curves Cryptography on $GF(p)$** , if NesLib is embedded only,
- **Secure Hashing (SHA-1, SHA-224, SHA-256, SHA-384, SHA-512)**, if NesLib is embedded only,
- Rivest-Shamir-Adleman (RSA), if NesLib is embedded only,
- **Deterministic Random Bit Generator (DRBG)**, if NesLib is embedded only,
- **Keccak**, if NesLib 5.2 is embedded,
- **Keccak-p**, if NesLib 5.2 is embedded,
- **Diffie-Hellman**, if NesLib 5.2 is embedded,
- **Prime Number Generation**, if NesLib is embedded only

Note that triple DES with two keys is no longer recommended as encryption function in the context of smart card applications. Hence, Security IC Embedded Software may need to use triple DES with three keys to achieve a suitable strength.

Note that SHA-1 is no longer recommended as a cryptographic function. Hence, Security IC Embedded Software may need to use another SHA to achieve a suitable strength.

P.Controlled-ES-Loading Controlled loading of the Security IC Embedded Software:

The TOE shall provide the capability to import the Security IC Embedded Software into the NVM, in a controlled manner, either before TOE delivery, under ST authority, either after TOE delivery, under the composite product manufacturer authority.

This capability is not available in User configuration.

P.Encryption Confidentiality during communication for MFPlus:

The TOE shall provide the possibility to protect selected data elements from eavesdropping during contact-less communication.

P.MAC Integrity during communication for MFPlus:

The TOE shall provide the possibility to protect the contact-less communication from modification or injections. This includes especially the possibility to detect replay or man-in-the-middle attacks within a session.

P.No-Trace-MFPlus Un-traceability of end-users for MFPlus:

The TOE shall provide the ability that authorised subjects can prevent that end-user of TOE may be traced by unauthorised subjects without consent. Tracing of end-users may happen by performing a contact-less communication with the TOE when the end-user is not aware of it. Typically this involves retrieving the UID or any freely accessible data element.

P.Confidentiality	Confidentiality during communication for DESFire: The TOE shall provide the possibility to protect selected data elements from eavesdropping during contact-less communication. The TOE shall also provide the possibility to detect replay or man-in-the-middle attacks within a session.
P.Transaction	Transaction mechanism for DESFire: The TOE shall provide the possibility to combine a number of data modification operations in one transaction, so that either all operations or no operation at all is performed.
P.No-Trace-DESFire	Un-traceability of end-users for DESFire: The TOE shall provide the ability that authorised subjects can prevent that end-user of TOE may be traced by unauthorised subjects without consent. Tracing of end-users may happen by performing a contact-less communication with the TOE when the end-user is not aware of it. Typically this involves retrieving the UID or any freely accessible data element.
P.Resp-Appl	Treatment of user data: The Security IC Embedded Software, part of the TOE, treats user data according to the assumption A.Resp-Appl defined in BSI-CC-PP-0084-2014.

3.4 Assumptions

111 The following assumptions are described in the [BSI-CC-PP-0084-2014](#), section 3.4.

BSI.A.Process-Sec-IC	Protection during Packaging, Finishing and Personalisation
BSI.A.Resp-Appl	Treatment of User Data of the Composite TOE

112 The following assumptions are defined for DESFire or MFPlus only. Thus, they do not contradict with the security problem definition of the [BSI-CC-PP-0084-2014](#), as they are only related to assets which are out of the scope of this PP.

113 In consequence, the addition of these assumptions does not contradict with the strict conformance claim on the [BSI-CC-PP-0084-2014](#).

114 The following assumptions are valid in case MFPlus is embedded in the TOE.

A.Secure-Values-MFPlus	Usage of secure values for MFPlus: Only confidential and secure keys shall be used to set up the authentication and access rights in MFPlus. These values are generated outside the TOE and they are downloaded to the TOE.
A.Terminal-Support-MFPlus	Terminal support to ensure integrity and confidentiality for MFPlus: The terminal verifies information sent by the TOE in order to ensure integrity and confidentiality of the communication.

115 The following assumptions are valid in case DESFire is embedded in the TOE.

A.Secure-Values-DESFire Usage of secure values for DESFire:

Only confidential and secure keys shall be used to set up the authentication and access rights in DESFire. These values are generated outside the TOE and they are downloaded to the TOE.

A.Terminal-Support-
DESFire

Terminal support to ensure integrity and confidentiality:

The terminal verifies information sent by the TOE in order to ensure integrity and confidentiality of the communication.

4 Security objectives (ASE_OBJ)

- 116 The security objectives of the TOE cover principally the following aspects:
- integrity and confidentiality of assets,
 - protection of the TOE and associated documentation during development and production phases,
 - provide random numbers,
 - provide cryptographic support and access control functionality.
- 117 A summary of all security objectives is provided in [Table 5](#).
- 118 Note that the origin of each objective is clearly identified in the prefix of its label. Most of these security aspects can therefore be easily found in the [BSI-CC-PP-0084-2014](#), sections 4.1 and 7.3. Only those originating in [AUG](#), and the ones introduced in this Security Target, are detailed in the following sections.

Table 5. Summary of security objectives

	Label	Title
TOE	BSI.O.Leak-Inherent	Protection against Inherent Information Leakage
	BSI.O.Phys-Probing	Protection against Physical Probing
	BSI.O.Malfunction	Protection against Malfunctions
	BSI.O.Phys-Manipulation	Protection against Physical Manipulation
	BSI.O.Leak-Forced	Protection against Forced Information Leakage
	BSI.O.Abuse-Func	Protection against Abuse of Functionality
	BSI.O.Identification	TOE Identification
	BSI.O.RND	Random Numbers
	BSI.O.Cap-Avail-Loader	Capability and Availability of the Loader
	AUG1.O.Add-Functions	Additional Specific Security Functionality
	AUG4.O.Mem-Access	Dynamic Area based Memory Access Control
	O.Controlled-ES-Loading	Controlled loading of the Security IC Embedded Software
	O.Access-Control-MFPlus	Access Control for MFPlus
	O.Authentication-MFPlus	Authentication for MFPlus
	O.Encryption	MFPlus Confidential Communication
	O.MAC-MFPlus	MFPlus integrity-protected Communication
	O.Type-Consistency-MFPlus	MFPlus Data type consistency
	O.No-Trace-MFPlus	Preventing Traceability for MFPlus
	O.Resp-Appl-MFPlus	Treatment of user data for MFPlus
	O.Resource-MFPlus	Resource availability for MFPlus
	O.Firewall-MFPlus	MFPlus firewall
	O.Shr-Var-MFPlus	MFPlus data cleaning for resource sharing

Table 5. Summary of security objectives (continued)

	Label	Title
TOE	<i>O.Access-Control-DESFire</i>	Access Control for DESFire
	<i>O.Authentication-DESFire</i>	Authentication for DESFire
	<i>O.Confidentiality-DESFire</i>	DESFire Confidential Communication
	<i>O.Type-Consistency-DESFire</i>	DESFire Data type consistency
	<i>O.Transaction-DESFire</i>	DESFire Transaction mechanism
	<i>O.No-Trace-DESFire</i>	Preventing Traceability for DESFire
	<i>O.Resp-Appl-DESFire</i>	Treatment of user data for DESFire
	<i>O.Resource-DESFire</i>	Resource availability for DESFire
	<i>O.Firewall-DESFire</i>	DESFire firewall
	<i>O.Shr-Res-DESFire</i>	DESFire data cleaning for resource sharing
	<i>O.Verification-DESFire</i>	DESFire code integrity check
Environments	BSI.OE.Resp-Appl	Treatment of User Data of the Composite TOE
	BSI.OE.Process-Sec-IC	Protection during composite product manufacturing
	BSI.OE.Lim-Block-Loader	Limitation of capability and blocking the Loader
	<i>OE.Secure-Values-MFPlus</i>	Generation of secure values for MFPlus
	<i>OE.Terminal-Support-MFPlus</i>	Terminal support to ensure integrity and confidentiality for MFPlus
	<i>OE.Secure-Values-DESFire</i>	Generation of secure values for DESFire
	<i>OE.Terminal-Support-DESFire</i>	Terminal support to ensure integrity and confidentiality for DESFire

4.1 Security objectives for the TOE

BSI.O.Leak-Inherent	Protection against Inherent Information Leakage
BSI.O.Phys-Probing	Protection against Physical Probing
BSI.O.Malfunction	Protection against Malfunctions
BSI.O.Phys-Manipulation	Protection against Physical Manipulation
BSI.O.Leak-Forced	Protection against Forced Information Leakage
BSI.O.Abuse-Func	Protection against Abuse of Functionality
BSI.O.Identification	TOE Identification
BSI.O.RND	Random Numbers
BSI.O.Cap-Avail-Loader	Capability and Availability of the Loader

AUG1.O.Add-Functions

Additional Specific Security Functionality:

The TOE must provide the following specific security functionality to the **Security IC** Embedded Software:

- Triple Data Encryption Standard (TDES),
- Advanced Encryption Standard (AES),
- **Elliptic Curves Cryptography on GF(p)**, if NesLib is embedded only,
- **Secure Hashing (SHA-1, SHA-224, SHA-256, SHA-384, SHA-512)**, if NesLib is embedded only,
- **Rivest-Shamir-Adleman (RSA)**, if NesLib is embedded only,
- **Deterministic Random Bit Generator (DRBG)**, if NesLib is embedded only,
- **Keccak**, if NesLib 5.2 is embedded,
- **Keccak-p**, if NesLib 5.2 is embedded,
- **Diffie-Hellman**, if NesLib 5.2 is embedded,
- **Prime Number Generation**, if NesLib is embedded.

Note that triple DES with two keys is no longer recommended as encryption function in the context of smart card applications. Hence, Security IC Embedded Software may need to use triple DES with three keys to achieve a suitable strength.

Note that SHA-1 is no longer recommended as a cryptographic function. Hence, Security IC Embedded Software may need to use another SHA to achieve a suitable strength.

AUG4.O.Mem-Access

Dynamic Area based Memory Access Control:

The TOE must provide the **Security IC** Embedded Software with the capability to define **dynamic memory segmentation and protection**. The TOE must then enforce **the defined access rules** so that access of software to memory areas is controlled as required, for example, in a multi-application environment.

O.Controlled-ES-Loading

Controlled loading of the Security IC Embedded Software:

The TOE must provide the capability to load the Security IC Embedded Software into the NVM, either before TOE delivery, under ST authority, either after TOE delivery, under the composite product manufacturer authority. The TOE must restrict the access to these features. The TOE must provide control means to check the integrity of the loaded user data. This capability is not available in User configuration.

O.Access-Control-MFPlus	Access Control for MFPlus: The TOE must provide an access control mechanism for data stored by it. The access control mechanism shall apply to all operations for data elements and to reading and modifying security attributes as well as authentication data. The cryptographic keys used for authentication shall never be output.
O.Authentication-MFPlus	Authentication for MFPlus: The TOE must provide an authentication mechanism in order to be able to authenticate authorised users. The authentication mechanism shall be resistant against replay and man-in-the-middle attacks.
O.Encryption	MFPlus Confidential Communication: The TOE must be able to protect the communication by encryption. This shall be implemented by security attributes that enforce encrypted communication for the respective data elements.
O.MAC-MFPlus	MFPlus Integrity-protected Communication: The TOE must be able to protect the communication by adding a MAC. This shall be mandatory for commands that modify data on the TOE and optional on read commands. In addition, a security attribute shall be available to mandate MAC on read commands, too. Usage of the protected communication shall also support the detection of injected and bogus commands within the communication session before the protected data transfer.
O.Type-Consistency-MFPlus	MFPlus Data type consistency: The TOE must provide a consistent handling of the different supported data types. This comprises over- and underflow checking for values and for block sizes.
O.No-Trace-MFPlus	Preventing Traceability for MFPlus: The TOE must be able to prevent that the TOE end-user can be traced. This shall be done by providing an option that disables the transfer of privacy-related information that is suitable for tracing an end-user by an unauthorised subject.
O.Resp-Appl-MFPlus	Treatment of user data for MFPlus: Security relevant User Data (especially cryptographic keys) are treated by the Security IC Embedded Software as required by the security needs of the specific application context. For example the Security IC Embedded Software will not disclose security relevant user data to unauthorised users or processes when communicating with a terminal.
O.Resource-MFPlus	Resource availability for MFPlus: The TOE shall control the availability of resources for MIFARE Plus Licensed product.

O.Firewall-MFPlus	MFPlus firewall : The TOE shall ensure isolation of data and code between MIFARE Plus and the other applications. An application shall not read, write, compare any piece of data or code belonging to the MIFARE Plus Licensed product.
O.Shr-Var-MFPlus	MFPlus data cleaning for resource sharing: It shall be ensured that any hardware resource, that is shared by MIFARE Plus and other applications or by any application which has access to such hardware resource, is always cleaned (using code that is part of the MIFARE Plus system and its certification) whenever MIFARE Plus is interrupted by the operation of another application. The only exception is buffers as long as these buffers do not contain other information than what is communicated over the contactless interface or has a form that is no different than what is normally communicated over the contactless interface. For example, no data shall remain in a hardware cryptographic coprocessor when MIFARE Plus is interrupted by another application. The cleaning must be done such that no information is leaking from this cleaning process allowing for among others timing or SPA/DPA attacks.
O.Verification-MFPlus	MFPlus code integrity check: The TOE shall ensure that MIFARE Plus code is verified for integrity and authenticity prior being executed.
120	The following objectives are only valid in case DESFire is embedded:
O.Access-Control-DESFire	Access Control for DESFire: The TOE must provide an access control mechanism for data stored by it. The access control mechanism shall apply to read, modify, create and delete operations for data elements and to reading and modifying security attributes as well as authentication data. It shall be possible to limit the right to perform a specific operation to a specific user. The security attributes (keys) used for authentication shall never be output.
O.Authentication-DESFire	Authentication for DESFire: The TOE must provide an authentication mechanism in order to be able to authenticate authorised users. The authentication mechanism shall be resistant against replay and man-in-the-middle attacks.

O.Confidentiality-DESFire	DESFire Confidential Communication: The TOE must be able to protect the communication by encryption. This shall be implemented by security attributes that enforce encrypted communication for the respective data element. The TOE shall also provide the possibility to detect replay or man-in-the-middle attacks within a session. This shall be implemented by checking verification data sent by the terminal and providing verification data to the terminal.
O.Type-Consistency-DESFire	DESFire Data type consistency: The TOE must provide a consistent handling of the different supported data types. This comprises over- and underflow checking for values, for data file sizes and record handling.
O.Transaction-DESFire	DESFire Transaction mechanism: The TOE must be able to provide a transaction mechanism that allows to update multiple data elements either all in common or none of them.
O.No-Trace-DESFire	Preventing Traceability for DESFire: The TOE must be able to prevent that the TOE end-user can be traced. This shall be done by providing an option that disables the transfer of any information that is suitable for tracing an end-user by an unauthorised subject.
O.Resp-Appl-DESFire	Treatment of user data for DESFire: Security relevant User Data (especially cryptographic keys) are treated by the Security IC Embedded Software as required by the security needs of the specific application context. For example the Security IC Embedded Software will not disclose security relevant user data to unauthorised users or processes when communicating with a terminal.
O.Resource-DESFire	Resource availability for DESFire: The TOE shall control the availability of resources for MIFARE DESFire EV1 Licensed product.
O.Firewall-DESFire	DESFire firewall: The TOE shall ensure isolation of data and code between MIFARE DESFire EV1 and the other applications. An application shall not read, write, compare any piece of data or code belonging to the MIFARE DESFire EV1 Licensed product.

O.Shr-Res-DESFire	DESFire data cleaning for resource sharing: It shall be ensured that any hardware resource, that is shared by MIFARE DESFire EV1 and other applications or by any application which has access to such hardware resource, is always cleaned (using code that is part of the MIFARE DESFire EV1 system and its certification) whenever MIFARE DESFire EV1 is interrupted by the operation of another application. The only exception is buffers as long as these buffers do not contain other information than what is communicated over the contactless interface or has a form that is no different than what is normally communicated over the contactless interface. For example, no data shall remain in a hardware cryptographic coprocessor when MIFARE DESFire EV1 is interrupted by another application.
O.Verification-DESFire	DESFire code integrity check: The TOE shall ensure that MIFARE DESFire EV1 code is verified for integrity and authenticity prior being executed.

4.2 Security objectives for the environment

- 121 Security Objectives for the Security IC Embedded Software development environment (phase 1):
- BSI.OE.Resp-Appl** **Treatment of User Data of the Composite TOE**
- 122 Security Objectives for the operational Environment (phase 4 up to 6):
- BSI.OE.Process-Sec-IC** **Protection during composite product manufacturing**
- BSI.OE.Lim-Block-Loader** **Limitation of capability and blocking the Loader**
- 123 This section details the security objectives for the operational environment, related to MFPlus or DESFire, and to be enforced after TOE delivery up to phase 7.
- 124 The following security objectives for the operational environment are only valid if **MFPlus** is embedded in the TOE:
- OE.Secure-Values-MFPlus Generation of secure values for MFPlus:
- The environment shall generate confidential and secure keys for authentication purpose. These values are generated outside the TOE and they are downloaded to the TOE during the personalisation or usage in phase 5 to 7.

	OE.Terminal-Support-MFPlus	Terminal support to ensure integrity and confidentiality for MFPlus: The terminal shall verify information sent by the TOE in order to ensure integrity and confidentiality of the communication. This involves checking of MAC values, verification of redundancy information according to the cryptographic protocol and secure closing of the communication session.
125	The following security objectives for the operational environment are only valid if DESFire is embedded in the TOE:	
	OE.Secure-Values-DESFire	Generation of secure values for DESFire: The environment shall generate confidential and secure keys for authentication purpose. These values are generated outside the TOE and they are downloaded to the TOE during the personalisation or usage in phase 5 to 7.
	OE.Terminal-Support-DESFire	Terminal support to ensure integrity and confidentiality for DESFire: The terminal shall verify information sent by the TOE in order to ensure integrity and confidentiality of the communication. This involves checking of MAC values, verification of redundancy information according to the cryptographic protocol and secure closing of the communication session.

4.3 Security objectives rationale

126	The main line of this rationale is that the inclusion of all the security objectives of the BSI-CC-PP-0084-2014 protection profile, together with those in AUG , and those introduced in this ST, guarantees that all the security environment aspects identified in Section 3 are addressed by the security objectives stated in this chapter.	
127	Thus, it is necessary to show that: - security environment aspects from AUG and from this ST, are addressed by security objectives stated in this chapter, - security objectives from AUG and from this ST, are suitable (i.e. they address security environment aspects), - security objectives from AUG and from this ST, are consistent with the other security objectives stated in this chapter (i.e. no contradictions).	
128	The selected augmentations from AUG introduce the following security environment aspects: - TOE threat "Memory Access Violation, (AUG4.T.Mem-Access)", - organisational security policy "Additional Specific Security Functionality, (AUG1.P.Add-Functions)".	
129	The augmentation made in this ST introduces the following security environment aspects: TOE threats "Unauthorised data modification for MFPlus, (T.Data-Modification-MFPlus)", "Impersonating authorised users during authentication for MFPlus, (T.Impersonate-MFPlus)", "Cloning for MFPlus, (T.Cloning-MFPlus)", "MFPlus code	

confidentiality, ([T.Confid-Applic-Code-MFPlus](#))", "MFPlus data confidentiality, ([T.Confid-Applic-Data-MFPlus](#))", "MFPlus code integrity, ([T.Integ-Applic-Code-MFPlus](#))", "MFPlus data integrity, ([T.Integ-Applic-Data-MFPlus](#))", "MFPlus resource unavailability, ([T.Application-Resource-MFPlus](#))", "Unauthorised data modification for DESFire, ([T.Data-Modification-DESFire](#))", "Impersonating authorised users during authentication for DESFire, ([T.Impersonate-DESFire](#))", "Cloning for DESFire, ([T.Cloning-DESFire](#))", "DESFire code confidentiality, ([T.Confid-Applic-Code-DESFire](#))", "DESFire data confidentiality, ([T.Confid-Applic-Data-DESFire](#))", "DESFire code integrity, ([T.Integ-Applic-Code-DESFire](#))", "DESFire data integrity, ([T.Integ-Applic-Data-DESFire](#))", and "DESFire resource unavailability, ([T.Resource-DESFire](#))".

- organisational security policies "Controlled loading of the Security IC Embedded Software, ([P.Controlled-ES-Loading](#))", "Confidentiality during communication for MFPlus, ([P.Encryption](#))", "Integrity during communication for MFPlus, ([P.MAC](#))", "Un-traceability of end-users for MFPlus, ([P.No-Trace-MFPlus](#))", "Confidentiality during communication for DESFire, ([P.Confidentiality](#))", "Transaction mechanism for DESFire, ([P.Transaction](#))", "Un-traceability of end-users for DESFire, ([P.No-Trace-DESFire](#))", and "Treatment of user data, ([P.Resp-Appl](#))".
- assumptions "Usage of secure values for MFPlus, ([A.Secure-Values-MFPlus](#))", and "Terminal support to ensure integrity and confidentiality for MFPlus, ([A.Terminal-Support-MFPlus](#))", "Usage of secure values for DESFire, ([A.Secure-Values-DESFire](#))", and "Terminal support to ensure integrity and confidentiality for DESFire, ([A.Terminal-Support-DESFire](#))".

130 The justification of the additional policies, additional threats, and additional assumptions provided in the next subsections shows that they do not contradict to the rationale already given in the protection profile [BSI-CC-PP-0084-2014](#) for the assumptions, policy and threats defined there.

131 In particular, the added assumptions and objectives on the environment do not contradict with the policies, threats and assumptions of the [BSI-CC-PP-0084-2014](#) Protection Profile, to which strict conformance is claimed, because they are all exclusively related to DESFire or MIFARE Plus, which are out of the scope of this protection profile.

4.3.1 Assumption "Usage of secure values for MFPlus"

- 132 The justification related to the assumption "Usage of secure values for MFPlus, (*A.Secure-Values-MFPlus*)" is as follows:
- 133 Since *OE.Secure-Values-MFPlus* requires secure values for the configuration of the authentication and access control as assumed in *A.Secure-Values-MFPlus*, the assumption is covered by the objective.
- 134 *A.Secure-Values-MFPlus* and *OE.Secure-Values-MFPlus* do not contradict with the security problem definition of the *BSI-CC-PP-0084-2014*, because they are only related to MFPlus, which is out of the scope of this protection profile.

4.3.2 Assumption "Terminal support to ensure integrity and confidentiality for MFPlus"

- 135 The justification related to the assumption "Terminal support to ensure integrity and confidentiality for MFPlus, (*A.Terminal-Support-MFPlus*)" is as follows:
- 136 The objective *OE.Terminal-Support-MFPlus* is an immediate transformation of the assumption *A.Terminal-Support-MFPlus*, therefore it covers the assumption.
- 137 *A.Terminal-Support-MFPlus* and *OE.Terminal-Support-MFPlus* do not contradict with the security problem definition of the *BSI-CC-PP-0084-2014*, because they are only related to MFPlus, which is out of the scope of this protection profile.

4.3.3 Assumption "Usage of secure values for DESFire"

- 138 The justification related to the assumption "Usage of secure values for DESFire, ([A.Secure-Values-DESFire](#))" is as follows:
- 139 Since [OE.Secure-Values-DESFire](#) requires from the Administrator, Application Manager or the Application User to use secure values for the configuration of the authentication and access control as assumed in [A.Secure-Values-DESFire](#), the assumption is covered by the objective.
- 140 [A.Secure-Values-DESFire](#) and [OE.Secure-Values-DESFire](#) do not contradict with the security problem definition of the [BSI-CC-PP-0084-2014](#), because they are only related to DESFire, which is out of the scope of this protection profile.

4.3.4 Assumption "Terminal support to ensure integrity and confidentiality for DESFire"

- 141 The justification related to the assumption "Terminal support to ensure integrity and confidentiality for DESFire, ([A.Terminal-Support-DESFire](#))" is as follows:
- 142 The objective [OE.Terminal-Support-DESFire](#) is an immediate transformation of the assumption [A.Terminal-Support-DESFire](#), therefore it covers the assumption.
- 143 [A.Terminal-Support-DESFire](#) and [OE.Terminal-Support-DESFire](#) do not contradict with the security problem definition of the [BSI-CC-PP-0084-2014](#), because they are only related to DESFire, which is out of the scope of this protection profile.

4.3.5 TOE threat "Memory Access Violation"

- 144 The justification related to the threat "Memory Access Violation, ([AUG4.T.Mem-Access](#))" is as follows:
- 145 According to [AUG4.O.Mem-Access](#) the TOE must enforce the **dynamic memory segmentation and protection** so that access of software to memory areas is controlled. Any restrictions are to be defined by the **Security IC** Embedded Software. Thereby security violations caused by accidental or deliberate access to restricted data (which may include code) can be prevented (refer to [AUG4.T.Mem-Access](#)). The threat [AUG4.T.Mem-Access](#) is therefore removed if the objective is met.
- 146 The added objective for the TOE [AUG4.O.Mem-Access](#) does not introduce any contradiction in the security objectives for the TOE.

4.3.6 TOE threat "Unauthorised data modification for MFPlus"

- 147 The justification related to the threat "Unauthorised data modification for MFPlus, ([T.Data-Modification-MFPlus](#))" is as follows:
- 148 According to threat [T.Data-Modification-MFPlus](#), the TOE shall avoid that user data stored by the TOE may be modified by unauthorised subjects. The objective [O.Access-Control-MFPlus](#) requires an access control mechanism that limits the ability to modify data elements stored by the TOE. [O.Type-Consistency-MFPlus](#) ensures that data types are adhered, so that data cannot be modified by abusing type-specific operations. The terminal must provide support by checking the TOE responses, which is required by [OE.Terminal-Support-MFPlus](#). Therefore [T.Data-Modification-MFPlus](#) is covered by these three objectives.
- 149 The added objectives for the TOE [O.Access-Control-MFPlus](#) and [O.Type-Consistency-MFPlus](#) do not introduce any contradiction in the security objectives for the TOE.

4.3.7 TOE threat "Impersonating authorised users during authentication for MFPlus"

- 150 The justification related to the threat "Impersonating authorised users during authentication for MFPlus, ([T.Impersonate-MFPlus](#))" is as follows:
- 151 The threat is related to the fact that an unauthorised subject may try to impersonate an authorised subject during authentication, e.g. by a man-in-the middle or replay attack. The goal of [O.Authentication-MFPlus](#) is that an authentication mechanism is implemented in the TOE that prevents these attacks. Therefore the threat is covered by [O.Authentication-MFPlus](#).
- 152 The added objective for the TOE [O.Authentication-MFPlus](#) does not introduce any contradiction in the security objectives for the TOE.

4.3.8 TOE threat "Cloning for MFPlus"

- 153 The justification related to the threat "Cloning for MFPlus, ([T.Cloning-MFPlus](#))" is as follows:
- 154 The concern of [T.Cloning-MFPlus](#) is that all data stored on the TOE (including keys) may be read out in order to create a duplicate. The objectives [O.Authentication-MFPlus](#) together with [O.Access-Control-MFPlus](#) require that unauthorised users cannot read any information that is restricted to the authorised subjects. The cryptographic keys used for the authentication are stored inside the TOE protected by [O.Access-Control-MFPlus](#). This objective states that the TOE shall never output any keys used for authentication. Therefore the two objectives cover [T.Cloning-MFPlus](#).

4.3.9 TOE threat "MFPlus resource unavailability"

- 155 The justification related to the threat "MFPlus resource unavailability, ([T.Application-Resource-MFPlus](#))" is as follows:
- 156 The concern of [T.Application-Resource-MFPlus](#) is to prevent denial of service or malfunction of MFPlus, that may result from an unavailability of resources. The goal of [O.Resource-MFPlus](#) is to control the availability of resources for MFPlus. Therefore the threat is covered by [O.Resource-MFPlus](#).
- 157 The added objective for the TOE [O.Resource-MFPlus](#) does not introduce any contradiction in the security objectives for the TOE.

4.3.10 TOE threat "MFPlus code confidentiality"

- 158 The justification related to the threat "MFPlus code confidentiality, ([T.Confid-Applic-Code-MFPlus](#))" is as follows:
- 159 Since [O.Firewall-MFPlus](#) requires that the TOE ensures isolation of code between MFPlus and the other applications, the code of MFPlus is protected against unauthorised disclosure, therefore [T.Confid-Applic-Code-MFPlus](#) is covered by [O.Firewall-MFPlus](#).
- 160 The added objective for the TOE [O.Firewall-MFPlus](#) does not introduce any contradiction in the security objectives for the TOE.

4.3.11 TOE threat "MFPlus data confidentiality"

- 161 The justification related to the threat "MFPlus data confidentiality, ([T.Confid-Applic-Data-MFPlus](#))" is as follows:

162 Since [O.Firewall-MFPlus](#) requires that the TOE ensures isolation of data between MFPlus and the other applications, the data of MFPlus is protected against unauthorised disclosure, therefore [T.Confid-Applic-Data-MFPlus](#) is covered by [O.Firewall-MFPlus](#).

4.3.12 TOE threat "MFPlus code integrity"

163 The justification related to the threat "MFPlus code integrity, ([T.Integ-Applic-Code-MFPlus](#))" is as follows:

164 The threat is related to the alteration of MFPlus code by an attacker. [O.Verification-MFPlus](#) requires that the TOE verifies the code integrity before its execution. Complementary, [O.Firewall-MFPlus](#) requires that the TOE ensures isolation of code between MFPlus and the other applications, thus protecting the code of MFPlus against unauthorised modification. Therefore the threat is covered by [O.Verification-MFPlus](#) together with [O.Firewall-MFPlus](#).

165 The added objective for the TOE [O.Verification-MFPlus](#) does not introduce any contradiction in the security objectives for the TOE.

4.3.13 TOE threat "MFPlus data integrity"

166 The justification related to the threat "MFPlus data integrity, ([T.Integ-Applic-Data-MFPlus](#))" is as follows:

167 The threat is related to the alteration of MFPlus data by an attacker. Since [O.Firewall-MFPlus](#) and [O.Shr-Var-MFPlus](#) require that the TOE ensures complete isolation of data between MFPlus and the other applications, the data of MFPlus is protected against unauthorised modification, therefore [T.Integ-Applic-Data-MFPlus](#) is covered by [O.Firewall-MFPlus](#) together with [O.Shr-Var-MFPlus](#).

168 The added objective for the TOE [O.Shr-Var-MFPlus](#) does not introduce any contradiction in the security objectives for the TOE.

4.3.14 TOE threat "Unauthorised data modification for DESFire"

169 The justification related to the threat "Unauthorised data modification for DESFire, ([T.Data-Modification-DESFire](#))" is as follows:

170 According to threat [T.Data-Modification-DESFire](#), the TOE shall avoid that user data stored by the TOE may be modified by unauthorised subjects. The objective [O.Access-Control-DESFire](#) requires an access control mechanism that limits the ability to modify data elements stored by the TOE. [O.Type-Consistency-DESFire](#) ensures that data types are adhered, so that data cannot be modified by abusing type-specific operations. The terminal must support this by checking the TOE responses, which is required by [OE.Terminal-Support-DESFire](#). Therefore [T.Data-Modification-DESFire](#) is covered by these three objectives.

171 The added objectives for the TOE [O.Access-Control-DESFire](#) and [O.Type-Consistency-DESFire](#) do not introduce any contradiction in the security objectives for the TOE.

4.3.15 TOE threat "Impersonating authorised users during authentication for DESFire"

172 The justification related to the threat "Impersonating authorised users during authentication for DESFire, ([T.Impersonate-DESFire](#))" is as follows:

173 The threat is related to the fact that an unauthorised subject may try to impersonate an authorised subject during authentication, e.g. by a man-in-the middle or replay attack. The goal of [O.Authentication-DESFire](#) is that an authentication mechanism is implemented in the TOE that prevents these attacks. Therefore the threat is covered by [O.Authentication-DESFire](#).

174 The added objective for the TOE [O.Authentication-DESFire](#) does not introduce any contradiction in the security objectives for the TOE.

4.3.16 TOE threat "Cloning for DESFire"

175 The justification related to the threat "Cloning for DESFire, ([T.Cloning-DESFire](#))" is as follows:

176 The concern of [T.Cloning-DESFire](#) is that all data stored on the TOE (including keys) may be read out in order to create a duplicate. The objective [O.Authentication-DESFire](#) together with [O.Access-Control-DESFire](#) requires that unauthorised users can not read any information that is restricted to the authorised subjects. The cryptographic keys used for the authentication are stored inside the TOE protected. [O.Access-Control-DESFire](#) states that no keys used for authentication shall ever be output. Therefore the two objectives cover [T.Cloning-DESFire](#).

4.3.17 TOE threat "DESFire resource unavailability"

177 The justification related to the threat "DESFire resource unavailability, ([T.Resource-DESFire](#))" is as follows:

178 The concern of [T.Resource-DESFire](#) is to prevent denial of service or malfunction of DESFire, that may result from an unavailability of resources. The goal of [O.Resource-DESFire](#) is to control the availability of resources for DESFire. Therefore the threat is covered by [O.Resource-DESFire](#).

179 The added objective for the TOE [O.Resource-DESFire](#) does not introduce any contradiction in the security objectives for the TOE.

4.3.18 TOE threat "DESFire code confidentiality"

180 The justification related to the threat "DESFire code confidentiality, ([T.Confid-Applic-Code-DESFire](#))" is as follows:

181 Since [O.Firewall-DESFire](#) requires that the TOE ensures isolation of code between DESFire and the other applications, the code of DESFire is protected against unauthorised disclosure, therefore [T.Confid-Applic-Code-DESFire](#) is covered by [O.Firewall-DESFire](#).

182 The added objective for the TOE [O.Firewall-DESFire](#) does not introduce any contradiction in the security objectives for the TOE.

4.3.19 TOE threat "DESFire data confidentiality"

183 The justification related to the threat "DESFire data confidentiality, ([T.Confid-Applic-Data-DESFire](#))" is as follows:

184 Since [O.Firewall-DESFire](#) requires that the TOE ensures isolation of data between DESFire and the other applications, the data of DESFire is protected against unauthorised disclosure, therefore [T.Confid-Applic-Data-DESFire](#) is covered by [O.Firewall-DESFire](#).

4.3.20 TOE threat "DESFire code integrity"

- 185 The justification related to the threat "DESFire code integrity, (*T.Integ-Applic-Code-DESFire*)" is as follows:
- 186 The threat is related to the alteration of DESFire code by an attacker. *O.Verification-DESFire* requires that the TOE verifies the code integrity before its execution. Complementary, *O.Firewall-DESFire* requires that the TOE ensures isolation of code between DESFire and the other applications, thus protecting the code of DESFire against unauthorised modification. Therefore the threat is covered by *O.Verification-DESFire* together with *O.Firewall-DESFire*.
- 187 The added objective for the TOE *O.Verification-DESFire* does not introduce any contradiction in the security objectives for the TOE.

4.3.21 TOE threat "DESFire data integrity"

- 188 The justification related to the threat "DESFire data integrity, (*T.Integ-Applic-Data-DESFire*)" is as follows:
- 189 The threat is related to the alteration of DESFire data by an attacker. Since *O.Firewall-DESFire* and *O.Shr-Res-DESFire* require that the TOE ensures isolation of data between DESFire and the other applications, the data of DESFire is protected against unauthorised modification, therefore *T.Integ-Applic-Data-DESFire* is covered by *O.Firewall-DESFire* together with *O.Shr-Res-DESFire*.
- 190 The added objective for the TOE *O.Shr-Res-DESFire* does not introduce any contradiction in the security objectives for the TOE.

4.3.22 Organisational security policy "Additional Specific Security Functionality"

- 191 The justification related to the organisational security policy "Additional Specific Security Functionality, (*AUG1.P.Add-Functions*)" is as follows:
- 192 Since *AUG1.O.Add-Functions* requires the TOE to implement exactly the same specific security functionality as required by *AUG1.P.Add-Functions*, **and in the very same conditions**, the organisational security policy is covered by the objective.
- 193 Nevertheless the security objectives *BSI.O.Leak-Inherent*, *BSI.O.Phys-Probing*, *BSI.O.Malfunction*, *BSI.O.Phys-Manipulation* and *BSI.O.Leak-Forced* define how to implement the specific security functionality required by *AUG1.P.Add-Functions*. (Note that these objectives support that the specific security functionality is provided in a secure way as expected from *AUG1.P.Add-Functions*.) Especially *BSI.O.Leak-Inherent* and *BSI.O.Leak-Forced* refer to the protection of confidential data (User Data or TSF data) in general. User Data are also processed by the specific security functionality required by *AUG1.P.Add-Functions*.
- 194 The added objective for the TOE *AUG1.O.Add-Functions* does not introduce any contradiction in the security objectives for the TOE.

4.3.23 Organisational security policy "Controlled loading of the Security IC Embedded Software"

- 195 The justification related to the organisational security policy "Controlled loading of the Security IC Embedded Software, (*P.Controlled-ES-Loading*)" is as follows:

196 Since [O.Controlled-ES-Loading](#) requires the TOE to implement exactly the same specific security functionality as required by [P.Controlled-ES-Loading](#), and in the very same conditions, the organisational security policy is covered by the objective.

197 The added objective for the TOE [O.Controlled-ES-Loading](#) does not introduce any contradiction in the security objectives.

4.3.24 Organisational security policy "Confidentiality during communication for MFPlus"

198 The justification related to the organisational security policy "Confidentiality during communication for MFPlus, ([P.Encryption](#))" is as follows:

199 The policy [P.Encryption](#) requires the TOE to provide the possibility to protect selected data elements from eavesdropping during contact-less communication. Since [O.Encryption](#) requires that the security attribute for a data element contains an option that the communication related to this data element must be encrypted, the objective covers the policy.

200 The added objective for the TOE [O.Encryption](#) does not introduce any contradiction in the security objectives.

4.3.25 Organisational security policy "Integrity during communication for MFPlus"

201 The justification related to the organisational security policy "Integrity during communication for MFPlus, ([P.MAC](#))" is as follows:

202 The policy [P.MAC](#) requires the TOE to provide the possibility to protect the contactless communication from modification or injections. This includes especially the possibility to detect replay or man-in-the-middle attacks within a session. [O.MAC-MFPlus](#) requires that a security attribute for the card contains an option that the communication must be MACed. In order to ensure the security the terminal must support the TOE by checking the MAC in the TOE responses, which is the goal of the objective [OE.Terminal-Support-MFPlus](#). Therefore both objectives cover the policy.

203 The added objective for the TOE [O.MAC-MFPlus](#) does not introduce any contradiction in the security objectives.

4.3.26 Organisational security policy "Un-traceability of end-users for MFPlus"

204 The justification related to the organisational security policy "Un-traceability of end-users for MFPlus, ([P.No-Trace-MFPlus](#))" is as follows:

205 The policy requires that the TOE has the ability to prevent tracing of end-users. Tracing can be performed with the UID or with any freely accessible data element stored by the TOE. The objective [O.No-Trace-MFPlus](#) requires that the TOE shall provide an option to prevent the transfer of any information that is suitable for tracing an end-user by an unauthorised subject, which includes the UID. The objectives [O.Authentication-MFPlus](#) and [O.Access-Control-MFPlus](#) provide means to authorise subjects and to implement access control to data elements in a way that unauthorised subjects can not read any element usable for tracing. Therefore the policy is covered by these three objectives.

206 The added objective for the TOE [O.No-Trace-MFPlus](#) does not introduce any contradiction in the security objectives.

4.3.27 Organisational security policy "Confidentiality during communication for DESFire"

207 The justification related to the organisational security policy "Confidentiality during communication for DESFire, ([P.Confidentiality](#))" is as follows:

208 The policy [P.Confidentiality](#) requires the TOE to provide the possibility to protect selected data elements from eavesdropping during contact-less communication. In addition, the data transfer is protected in a way that injected and bogus commands, within the communication session before the protected data transfer, can be detected. The terminal must support this by checking the TOE responses, which is required by [OE.Terminal-Support-DESFire](#). Since [O.Confidentiality-DESFire](#) requires that the security attribute for a data element contains an option that the communication related to this data element must be encrypted and protected, and because [OE.Terminal-Support-DESFire](#) ensures the support by the terminal, the two objectives cover the policy.

209 The added objective for the TOE [O.Confidentiality-DESFire](#) does not introduce any contradiction in the security objectives.

4.3.28 Organisational security policy "Transaction mechanism for DESFire"

210 The justification related to the organisational security policy "Transaction mechanism for DESFire, ([P.Transaction](#))" is as follows:

211 According to this policy, the TOE shall be able to provide the possibility to combine a number of data modification operations in one transaction, so that either all operations or no operation at all is performed. This is exactly the goal of the objective [O.Transaction-DESFire](#), therefore the policy [P.Transaction](#) is covered by [O.Transaction-DESFire](#).

212 The added objective for the TOE [O.Transaction-DESFire](#) does not introduce any contradiction in the security objectives.

4.3.29 Organisational security policy "Un-traceability of end-users for DESFire"

213 The justification related to the organisational security policy "Un-traceability of end-users for DESFire, ([P.No-Trace-DESFire](#))" is as follows:

214 The policy requires that the TOE has the ability to prevent tracing of end-users. Tracing can be performed with the UID or with any freely accessible data element stored by the TOE. The objective [O.No-Trace-DESFire](#) requires that the TOE shall provide an option to prevent the transfer of any information that is suitable for tracing an end-user by an unauthorised subject, which includes the UID. The objectives [O.Authentication-DESFire](#) and [O.Access-Control-DESFire](#) provide means to authorise subjects and to implement access control to data elements in a way that unauthorised subjects cannot read any element usable for tracing. Therefore the policy is covered by these three objectives.

215 The added objective for the TOE [O.No-Trace-DESFire](#) does not introduce any contradiction in the security objectives.

4.3.30 Organisational security policy "Treatment of user data"

- 216 The justification related to the organisational security policy "Treatment of user data, (*P.Resp-Appl*)" is as follows:
- 217 The policy states that the Security IC Embedded Software included in the TOE, treats user data according to the PP assumption *BSI.A.Resp-Appl*. *O.Resp-Appl-DESFire* and *O.Resp-Appl-MFPlus* have the same objective as *BSI.OE.Resp-Appl* defined in the PP. Thus, the objectives *O.Resp-Appl-DESFire* and/or *O.Resp-Appl-MFPlus* cover the policy *P.Resp-Appl*.
- 218 The added objectives for the TOE *O.Resp-Appl-DESFire* and *O.Resp-Appl-MFPlus* do not introduce any contradiction in the security objectives.

5 Security requirements (ASE_REQ)

219 This chapter on security requirements contains a section on security functional requirements (SFRs) for the TOE ([Section 5.1](#)), a section on security assurance requirements (SARs) for the TOE ([Section 5.2](#)), a section on the refinements of these SARs ([Section 5.3](#)) as required by the "[BSI-CC-PP-0084-2014](#)" Protection Profile. This chapter includes a section with the security requirements rationale ([Section 5.4](#)).

5.1 Security functional requirements for the TOE

220 Security Functional Requirements (SFRs) from the "[BSI-CC-PP-0084-2014](#)" Protection Profile (PP) are drawn from [CCMB-2012-09-002 R4](#), except the following SFRs, that are **extensions** to [CCMB-2012-09-002 R4](#):

- **FCS_RNG** Generation of random numbers,
- **FMT_LIM** Limited capabilities and availability,
- **FAU_SAS** Audit data storage,
- **FDP_SDC** Stored data confidentiality.

The reader can find their certified definitions in the text of the "[BSI-CC-PP-0084-2014](#)" Protection Profile.

221 All extensions to the SFRs of the "[BSI-CC-PP-0084-2014](#)" Protection Profiles (PPs) are **exclusively** drawn from [CCMB-2012-09-002 R4](#).

222 All iterations, assignments, selections, or refinements on SFRs have been performed according to section C.4 of [CCMB-2012-09-001 R4](#). They are easily identified in the following text as they appear **as indicated here**. Note that in order to improve readability, iterations are sometimes expressed within tables.

223 In order to ease the definition and the understanding of these security functional requirements, a simplified presentation of the TOE Security Policy (TSP) is given in the following section.

224 The selected security functional requirements for the TOE, their respective origin and type are summarized in [Table 7](#).

Table 7. Summary of functional security requirements for the TOE

Label	Title	Addressing	Origin	Type
FRU_FLT.2	Limited fault tolerance	Malfunction	BSI-CC-PP-0084-2014	CCMB-2012-09-002 R4
FPT_FLS.1	Failure with preservation of secure state			

Table 7. Summary of functional security requirements for the TOE (continued)

Label	Title	Addressing	Origin	Type
FMT_LIM.1 / Test	Limited capabilities	Abuse of Test functionality	BSI-CC-PP-0084-2014	Extended
FMT_LIM.2 / Test	Limited availability			
FMT_LIM.1 / Loader	Limited capabilities	Abuse of Loader functionality	BSI-CC-PP-0084-2014 Operated	
FMT_LIM.2 / Loader	Limited availability			
FAU_SAS.1	Audit storage	Lack of TOE identification		CCMB-2012-09-002 R4
FDP_SDC.1	Stored data confidentiality	Physical manipulation & probing		
FDP_SDI.2	Stored data integrity monitoring and action			
FPT_PHP.3	Resistance to physical attack			
FDP_ITT.1	Basic internal transfer protection	Leakage	BSI-CC-PP-0084-2014	
FPT_ITT.1	Basic internal TSF data transfer protection			
FDP_IFC.1	Subset information flow control			
FCS_RNG.1	Random number generation	Weak cryptographic quality of random numbers	BSI-CC-PP-0084-2014 Operated	Extended
FCS_COP.1	Cryptographic operation	Cipher scheme support	AUG #1 Operated	CCMB-2012-09-002 R4
FCS_CKM.1 (if NesLib is embedded only)	Cryptographic key generation		Security Target Operated	
FDP_ACC.2 / Memories	Complete access control	Memory access violation	Security Target Operated	
FDP_ACF.1 / Memories	Security attribute based access control			
FMT_MSA.3 / Memories	Static attribute initialisation	Correct operation	AUG #4 Operated	
FMT_MSA.1 / Memories	Management of security attribute			
FMT_SMF.1 / Memories	Specification of management functions		Security Target Operated	

Table 7. Summary of functional security requirements for the TOE (continued)

Label	Title	Addressing	Origin	Type
FDP_ITC.1 / Loader	Import of user data without security attributes	User data loading access violation	Security Target Operated	CCMB-2012-09-002 R4
FDP_ACC.1 / Loader	Subset access control			
FDP_ACF.1 / Loader	Security attribute based access control			
FMT_MSA.3 / Loader	Static attribute initialisation	Correct operation		
FMT_MSA.1 / Loader	Management of security attribute			
FMT_SMR.1 / Loader	Security roles	Abuse of Admin functionality		
FIA_UID.1 / Loader	Timing of identification			
FMT_SMF.1 / Loader	Specification of management functions			
FMT_SMR.1 / MFPlus	Security roles			
FDP_ACC.1 / MFPlus	Subset access control			
FDP_ACF.1 / MFPlus	Security attribute based access control			
FMT_MSA.3 / MFPlus	Static attribute initialisation	MFPlus access control (if MFPlus is embedded only)		
FMT_MSA.1 / MFPlus	Management of security attribute			
FMT_SMF.1 / MFPlus	Specification of management functions			
FDP_ITC.2 / MFPlus	Import of user data with security attributes			
FPT_TDC.1 / MFPlus	Inter-TSF basic TSF data consistency			

Table 7. Summary of functional security requirements for the TOE (continued)

Label	Title	Addressing	Origin	Type
FIA_UID.2 / MFPlus	User identification before any action	MFPlus confidentiality and authentication (if MFPlus is embedded only)	Security Target Operated	CCMB-2012-09-002 R4
FIA_UAU.2 / MFPlus	User authentication before any action			
FIA_UAU.5 / MFPlus	Multiple authentication mechanisms			
FMT_MTD.1 / MFPlus	Management of TSF data			
FPT_TRP.1 / MFPlus	Trusted path			
FCS_CKM.4 / MFPlus	Cryptographic key destruction	MFPlus robustness (if MFPlus is embedded only)		
FPT_RPL.1 / MFPlus	Replay detection			
FPR_UNL.1 / MFPlus	Unlinkability			
FRU_RSA.2 / MFPlus	Minimum and maximum quotas	MFPlus correct operation (if MFPlus is embedded only)		
FDP_RIP.1 / MFPlus	Subset residual information protection	MFPlus intrinsic confidentiality and integrity (if MFPlus is embedded only)		

Table 7. Summary of functional security requirements for the TOE (continued)

Label	Title	Addressing	Origin	Type
FMT_SMR.1 / DESFire	Security roles	DESFire access control (if DESFire is embedded only)	Security Target Operated	CCMB-2012-09-002 R4
FDP_ACC.1 / DESFire	Subset access control			
FDP_ACF.1 / DESFire	Security attribute based access control			
FMT_MSA.3 / DESFire	Static attribute initialisation			
FMT_MSA.1 / DESFire	Management of security attribute			
FMT_SMF.1 / DESFire	Specification of management functions			
FDP_ITC.2 / DESFire	Import of user data with security attributes			
FPT_TDC.1 / DESFire	Inter-TSF basic TSF data consistency	DESFire confidentiality and authentication (if DESFire is embedded only)		
FIA_UID.2 / DESFire	User identification before any action			
FIA_UAU.2 / DESFire	User authentication before any action			
FIA_UAU.5 / DESFire	Multiple authentication mechanisms			
FMT_MTD.1 / DESFire	Management of TSF data			
FPT_TRP.1 / DESFire	Trusted path			
FCS_CKM.4 / DESFire	Cryptographic key destruction	DESFire robustness (if DESFire is embedded only)		
FDP_ROL.1 / DESFire	Basic rollback			
FPT_RPL.1 / DESFire	Replay detection			
FPR_UNL.1 / DESFire	Unlinkability			
FRU_RSA.2 / DESFire	Minimum and maximum quotas	DESFire correct operation (if DESFire is embedded only)		

Table 7. Summary of functional security requirements for the TOE (continued)

Label	Title	Addressing	Origin	Type
FDP_RIP.1 / DESFire	Subset residual information protection	DESFire intrinsic confidentiality and integrity (if DESFire is embedded only)	Security Target Operated	CCMB-2012-09-002 R4
FDP_ACC.1 / APPLI_FWL	Subset access control	DESFire or MFPlus or application intrinsic confidentiality and integrity		
FDP_ACF.1 / APPLI_FWL	Security attribute based access control			
FMT_MSA.3 / APPLI_FWL	Static attribute initialisation			

5.1.1 Security Functional Requirements from the Protection Profile

Limited fault tolerance (FRU_FLT.2)

- 225 The TSF shall ensure the operation of all the TOE's capabilities when the following failures occur: **exposure to operating conditions which are not detected according to the requirement Failure with preservation of secure state (FPT_FLS.1).**

Failure with preservation of secure state (FPT_FLS.1)

- 226 The TSF shall preserve a secure state when the following types of failures occur: **exposure to operating conditions which may not be tolerated according to the requirement Limited fault tolerance (FRU_FLT.2) and where therefore a malfunction could occur.**

227 Refinements:

The term "failure" above also covers "circumstances". The TOE prevents failures for the "circumstances" defined above.

Regarding application note 14 of BSI-CC-PP-0084-2014, the secure state is reached by an immediate interrupt or by a reset, depending on the current context.

Regarding application note 15 of BSI-CC-PP-0084-2014, the TOE provides information on the operating conditions monitored during Security IC Embedded Software execution and after a warm reset. No audit requirement is however selected in this Security Target.

Limited capabilities (FMT_LIM.1) / Test

- 228 The TSF shall be designed and implemented in a manner that limits their capabilities so that in conjunction with "Limited availability (FMT_LIM.2)" the following policy is enforced: **Limited capability and availability Policy / Test.**

Limited availability (FMT_LIM.2) / Test

- 229 The TSF shall be designed and implemented in a manner that limits their availability so that in conjunction with "Limited capabilities (FMT_LIM.1) / Test" the following policy is enforced: **Limited capability and availability Policy / Test.**

- 230 SFP_1: Limited capability and availability Policy / Test

Deploying Test Features after TOE Delivery does not allow User Data of the Composite TOE to be disclosed or manipulated, TSF data to be disclosed or manipulated, software to be reconstructed and no substantial information about construction of TSF to be gathered which may enable other attacks.

Audit storage (FAU_SAS.1)

- 231 The TSF shall provide **the test process before TOE Delivery** with the capability to store the **Initialisation Data and/or Pre-personalisation Data and/or supplements of the Security IC Embedded Software** in the **NVM**.

Stored data confidentiality (FDP_SDC.1)

- 232 The TSF shall ensure the confidentiality of the information of the user data while it is stored in **all the memory areas where it can be stored**.

Stored data integrity monitoring and action (FDP_SDI.2)

- 233 The TSF shall monitor user data stored in containers controlled by the TSF for **integrity errors** on all objects, based on the following attributes: **user data stored in all possible memory areas, depending on the integrity control attributes**.
- 234 Upon detection of a data integrity error, the TSF shall **signal the error and react**.

Resistance to physical attack (FPT_PHP.3)

- 235 The TSF shall resist **physical manipulation and physical probing**, to the **TSF** by responding automatically such that the SFRs are always enforced.

236 Refinement:

The TSF will implement appropriate mechanisms to continuously counter physical manipulation and physical probing. Due to the nature of these attacks (especially manipulation) the TSF can by no means detect attacks on all of its elements. Therefore, permanent protection against these attacks is required ensuring that security functional requirements are enforced. Hence, "automatic response" means here (i) assuming that there might be an attack at any time and (ii) countermeasures are provided at any time.

Basic internal transfer protection (FDP_ITT.1)

- 237 The TSF shall enforce the **Data Processing Policy** to prevent the **disclosure** of user data when it is transmitted between physically-separated parts of the TOE.

Basic internal TSF data transfer protection (FPT_ITT.1)

- 238 The TSF shall protect TSF data from **disclosure** when it is transmitted between separate parts of the TOE.

239 Refinement:

The different memories, the CPU and other functional units of the TOE (e.g. a cryptographic co-processor) are seen as separated parts of the TOE.

This requirement is equivalent to FDP_ITT.1 above but refers to TSF data instead of User Data. Therefore, it should be understood as to refer to the same Data Processing Policy defined under FDP_IFC.1 below.

Subset information flow control (FDP_IFC.1)

240 The TSF shall enforce the **Data Processing Policy** on *all confidential data when they are processed or transferred by the TOE or by the Security IC Embedded Software*.

241 SFP_2: Data Processing Policy

User Data of the Composite TOE and TSF data shall not be accessible from the TOE except when the Security IC Embedded Software decides to communicate the User Data via an external interface. The protection shall be applied to confidential data only but without the distinction of attributes controlled by the Security IC Embedded Software.

Random number generation (FCS_RNG.1)

242 The TSF shall provide a **physical** random number generator that implements:

- **(PTG.2.1) A total failure test detects a total failure of entropy source immediately when the RNG has started. When a total failure is detected, no random numbers will be output.**
- **(PTG.2.2) If a total failure of the entropy source occurs while the RNG is being operated, the RNG prevents the output of any internal random number that depends on some raw random numbers that have been generated after the total failure of the entropy source.**
- **(PTG.2.3) The online test shall detect non-tolerable statistical defects of the raw random number sequence (i) immediately when the RNG has started, and (ii) while the RNG is being operated. The TSF must not output any random numbers before the power-up online test has finished successfully or when a defect has been detected.**
- **(PTG.2.4) The online test procedure shall be effective to detect non-tolerable weaknesses of the random numbers soon.**
- **(PTG.2.5) The online test procedure checks the quality of the raw random number sequence. It is triggered externally. The online test is suitable for detecting non-tolerable statistical defects of the statistical properties of the raw random numbers within an acceptable period of time.**

243 The TSF shall provide **octets of bits** that meet

- **(PTG.2.6) Test procedure A does not distinguish the internal random numbers from output sequences of an ideal RNG.**
- **(PTG.2.7) The average Shannon entropy per internal random bit exceeds 0.997.**

5.1.2 Additional Security Functional Requirements for the cryptographic services

Cryptographic operation (FCS_COP.1)

244 The TSF shall perform **the operations in Table 8** in accordance with a specified cryptographic algorithm **in Table 8** and cryptographic key sizes **of Table 8** that meet the **standards in Table 8**. **The list of operations depends on the presence of NesLib, as indicated in Table 8 (Restrict).**

Table 8. FCS_COP.1 iterations (cryptographic operations)

Restrict	Iteration label	[assignment: list of cryptographic operations]	[assignment: cryptographic algorithm]	[assignment: cryptographic key sizes]	[assignment: list of standards]
Even without NesLib	TDES	* encryption * decryption - in Cipher Block Chaining (CBC) mode - in Electronic Code Book (ECB) mode	Triple Data Encryption Standard (TDES) ⁽¹⁾	168 bits	NIST SP 800-67 NIST SP 800-38A
Even without NesLib	AES	* encryption (cipher) * decryption (inverse cipher) * key expansion * randomize	Advanced Encryption Standard	128, 192 and 256 bits	FIPS PUB 197
If NesLib and Nescrypt	RSA	* RSA public key operation * RSA private key operation without the Chinese Remainder Theorem * RSA private key operation with the Chinese Remainder Theorem * EMSA PSS and PKCS1 signature scheme coding	Rivest, Shamir & Adleman's	up to 4096 bits	PKCS #1 V2.1

Table 8. FCS_COP.1 iterations (cryptographic operations) (continued)

Restrict	Iteration label	[assignment: list of cryptographic operations]	[assignment: cryptographic algorithm]	[assignment: cryptographic key sizes]	[assignment: list of standards]
If NesLib and Nescrypt	ECC	* private scalar multiplication * prepare Jacobian * public scalar multiplication * point validity check * convert Jacobian to affine coordinates * general point addition * point expansion * point compression * Diffie-Hellman (ECDH) key agreement computation * digital signature algorithm (ECDSA) generation and verification	Elliptic Curves Cryptography on GF(p)	up to 640 bits	IEEE 1363-2000, chapter 7 IEEE 1363a-2004 NIST SP 800-56A FIPS PUB 186-4 ANSI X9.62, section 7
If NesLib	SHA	* SHA-1⁽²⁾ * SHA-224 * SHA-256 * SHA-384 * SHA-512 * Protected SHA-1⁽²⁾ * Protected SHA-256	Secure Hash Algorithm	assignment pointless because algorithm has no key	FIPS PUB 180-2
		* HMAC		up to 256 bits	FIPS PUB 198-1
If NesLib	DRBG	* SHA-1⁽²⁾ * SHA-224 * SHA-256 * SHA-384 * SHA-512	Hash-DRBG	None	NIST SP 800-90 FIPS PUB 180-2
		*AES	CTR-DRBG	128, 192 and 256 bits	NIST SP 800-90 FIPS PUB 197

Table 8. FCS_COP.1 iterations (cryptographic operations) (continued)

Restrict	Iteration label	[assignment: list of cryptographic operations]	[assignment: cryptographic algorithm]	[assignment: cryptographic key sizes]	[assignment: list of standards]
If NesLib 5.2	Keccak	* SHAKE128, * SHAKE256, * SHA3-224, * SHA3-256, * SHA3-384, * SHA3-512, * Keccak[r,1600-r], * protected SHAKE128, * protected SHAKE256, * protected SHA3-224, * protected SHA3-256, * protected SHA3-384, * protected SHA3-512, * Protected Keccak[r,1600-r]	Keccak	no key for plain functions, variable key length up to security level for protected functions (security level is last number in function names and 1600-c for Keccak)	FIPS PUB 202
If NesLib 5.2	Keccak-p	* Keccak-p[1600,n_r = 24], * Keccak-p[1600, n_r=12], * protected Keccak-p[1600,n_r = 24], * protected Keccak-p[1600, n_r=12]	Keccak-p	no key for plain functions, any key length up to 256 bits for protected functions	FIPS PUB 202
If NesLib 5.2 and Nescrypt	Diffie-Hellman	Diffie-Hellman	Diffie-Hellman	up to 4096 bits	ANSI X9.42

1. Note that triple DES with two keys is no longer recommended as encryption function in the context of smart card applications. Hence, Security IC Embedded Software may need to use triple DES with three keys to achieve a suitable strength.
2. Note that SHA-1 is no longer recommended as a cryptographic function. Hence, Security IC Embedded Software may need to use another SHA to achieve a suitable strength.

Cryptographic key generation (FCS_CKM.1)

245 If NesLib is embedded only, the TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm, *in Table 9*, and specified cryptographic key sizes *of Table 9* that meet the following **standards in Table 9**.

Table 9. FCS_CKM.1 iterations (cryptographic key generation)

Iteration label	[assignment: cryptographic key generation algorithm]	[assignment: cryptographic key sizes]	[assignment: list of standards]
Prime generation	prime generation and RSA prime generation algorithm, optionally protected against side channel attacks, and/or optionally with conditions	up to 2048 bits	FIPS PUB 140-2 FIPS PUB 186-4
RSA key generation	RSA key pair generation algorithm, optionally protected against side channel attacks, and/or optionally with conditions	up to 4096 bits	FIPS PUB 140-2 ISO/IEC 9796-2 PKCS #1 V2.1

5.1.3 Additional Security Functional Requirements for the memories protection

246 The following SFRs are extensions to "[BSI-CC-PP-0084-2014](#)" Protection Profile (PP), related to the memories protection.

Static attribute initialisation (FMT_MSA.3) / Memories

247 The TSF shall enforce the **Dynamic Memory Access Control Policy** to provide **minimally protective**^(b) default values for security attributes that are used to enforce the SFP.

248 The TSF shall allow **none** to specify alternative initial values to override the default values when an object or information is created.

Application note:

The security attributes are the set of access rights currently defined. They are dynamically attached to the subjects and objects locations, i.e. each logical address.

Management of security attributes (FMT_MSA.1) / Memories

249 The TSF shall enforce the **Dynamic Memory Access Control Policy** to restrict the ability to **modify** the security attributes **current set of access rights** to **software running in privileged mode**.

Complete access control (FDP_ACC.2) / Memories

250 The TSF shall enforce the **Dynamic Memory Access Control Policy** on **all subjects (software)**, **all objects (data including code stored in memories)** and all operations among subjects and objects covered by the SFP.

251 The TSF shall ensure that all operations between any subject controlled by the TSF and any object controlled by the TSF are covered by an access control SFP.

b. See the Datasheet referenced in [Section 7](#) for actual values.

Security attribute based access control (FDP_ACF.1) / Memories

- 252 The TSF shall enforce the **Dynamic Memory Access Control Policy** to objects based on the following: **software mode, the object location, the operation to be performed, and the current set of access rights.**
- 253 The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: **the operation is allowed if and only if the software mode, the object location and the operation matches an entry in the current set of access rights.**
- 254 The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: **none.**
- 255 The TSF shall explicitly deny access of subjects to objects based on the following additional rules: **in User configuration, any access (read, write, execute) to the OST ROM is denied, and in User configuration, any write access to the ST NVM is denied.**
- 256 **Note:** It should be noted that this level of policy detail is not needed at the application level. The composite Security Target writer should describe the ES access control and information flow control policies instead. Within the ES High Level Design description, the chosen setting of IC security attributes would be shown to implement the described policies relying on the IC SFP presented here.
- 257 The following SFP **Dynamic Memory Access Control Policy** is defined for the requirement "Security attribute based access control (FDP_ACF.1) / Memories":
- 258 **SFP_3: Dynamic Memory Access Control Policy**
The TSF must control read, write, execute accesses of software to data, based on the software mode and on the current set of access rights.

Specification of management functions (FMT_SMF.1) / Memories

- 259 The TSF will be able to perform the following management functions: **modification of the current set of access rights security attributes by software running in privileged mode, supporting the Dynamic Memory Access Control Policy.**

5.1.4 Additional Security Functional Requirements related to the possible availability of final test and loading capabilities in phases 4 to 6 of the TOE life-cycle

Limited capabilities (FMT_LIM.1) / Loader

- 260 The TSF shall be designed and implemented in a manner that limits its capabilities so that in conjunction with "Limited availability (FMT_LIM.2)" the following policy is enforced: **Loader Limited capability Policy.**
- 261 **SFP_4: Loader Limited capability Policy**
 262 *Deploying Loader functionality after blocking of the loader does not allow stored user data to be disclosed or manipulated by unauthorized user.*

Limited availability (FMT_LIM.2) / Loader

- 263 The TSF shall be designed and implemented in a manner that limits its availability so that in conjunction with "Limited capabilities (FMT_LIM.1)" the following policy is enforced: **Loader Limited availability Policy.**

264 SFP_5: Loader Limited availability Policy

265 *The TSF prevents deploying the Loader functionality after blocking of the loader.*

Import of user data without security attributes (FDP_ITC.1) / Loader

266 The TSF shall enforce the **Loading Access Control Policy** when importing user data, controlled under the SFP, from outside of the TOE.

267 The TSF shall ignore any security attributes associated with the User data when imported from outside of the TOE.

268 The TSF shall enforce the following rules when importing user data controlled under the SFP from outside of the TOE:

- ***the integrity of the loaded user data is checked at the end of each loading session,***
- ***the loaded user data is received encrypted, internally decrypted, then stored into the NVM.***

Static attribute initialisation (FMT_MSA.3) / Loader

269 The TSF shall enforce the **Loading Access Control Policy** to provide **restrictive** default values for security attributes that are used to enforce the SFP.

270 The TSF shall allow **none** to specify alternative initial values to override the default values when an object or information is created.

Management of security attributes (FMT_MSA.1) / Loader

271 The TSF shall enforce the **Loading Access Control Policy** to restrict the ability to **modify** the security attributes **remaining loading sessions** to **the Loader Administrator**.

Subset access control (FDP_ACC.1) / Loader

272 The TSF shall enforce the **Loading Access Control Policy** on **all subjects, object NVM and all commands**.

Security attribute based access control (FDP_ACF.1) / Loader

273 The TSF shall enforce the **Loading Access Control Policy** to objects based on the following: **the TOE mode, the user authenticated role, the remaining loading sessions and the requested command, according to the fixed loader access rights**.

274 The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: **the command is allowed if and only if the TOE mode, the user authenticated role, the remaining loading sessions and the requested command match an entry in the fixed loader access rights**.

275 The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: **none**.

276 The TSF shall explicitly deny access of subjects to objects based on the following additional rules: **in User mode, no loader command is deployed**.

277 The following SFP **Loading Access Control Policy** is defined for the requirement "Security attribute based access control (FDP_ACF.1) / Loader":

278 SFP_6: Loading Access Control Policy

- 279 *The TSF must enforce that only authorised users are allowed to download User code and data into the User NVM or to set the product profile.*
The TSF must enforce that only authorised users are allowed to be administrator of the provided loader functionality.
The TSF controls access to the loader functionality based on the TOE mode, the user authenticated role, the remaining loading sessions and the requested command according to the fixed loader access rights.

Specification of management functions (FMT_SMF.1) / Loader

- 280 The TSF will be able to perform the following management functions: ***change the TOE mode, change the user role, change the remaining sessions.***

Security roles (FMT_SMR.1) / Loader

- 281 The TSF shall maintain the roles: ***Loader and Loader Administrator.***
 282 The TSF shall be able to associate users with roles.

Timing of identification (FIA_UID.1) / Loader

- 283 The TSF shall allow ***boot and authentication command*** on behalf of the user to be performed before the user is identified.
 284 The TSF shall require each user to be successfully identified before allowing any other TSF mediated actions on behalf of that user.

5.1.5 Additional Security Functional Requirements related to MFPlus

- 285 The following SFRs are extensions to "[BSI-CC-PP-0084-2014](#)" Protection Profile (PP), related to the capabilities and protections of MFPlus.
 286 They are only valid in case **MFPlus** is embedded.
 287 **Note:** MIFARE Plus X library directly relies upon the following IC SFRs:
- FRU_FLT.2 in providing services as part of the security countermeasures implemented in the library,
 - FPT_FLS.1 in order to generate a software reset and check the code integrity in NVM,
 - FCS_RNG.1 for the provision of random numbers,
 - FCS_COP.1 / AES for AES cryptographic operations.
- 288 It also relies upon the other SFRs (except those of NesLib), which provide general low level security mechanisms.

Security roles (FMT_SMR.1) / MFPlus

- 289 The TSF shall maintain the roles ***Personaliser, Card Administrator, Card Manager, Card Security Level Manager, Card User and Originality Key User.***
 290 The TSF shall be able to associate users with roles.

Subset access control (FDP_ACC.1) / MFPlus

- 291 The TSF shall enforce the ***MFPlus Access Control Policy*** on ***all subjects, objects, operations and attributes defined by the MFPlus Access Control Policy.***

Security attribute based access control (FDP_ACF.1) / MFPlus

- 292 The TSF shall enforce the **MFPlus Access Control Policy** to objects based on the following: **all subjects, objects and attributes**.
- 293 The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:
- **The Personaliser can change all blocks.**
 - **For every sector the Card User can read or write a data block; read, increase, decrease, transfer or restore a value based on the access control settings in the respective sector trailer.**
- 294 The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: **none**
- 295 The TSF shall explicitly deny access of subjects to objects based on the **rules**:
- **The block 0 (first block of the first sector) can not be modified.**
- 296 The following SFP **MFPlus Access Control Policy** is defined for the requirement "Security attribute based access control (FDP_ACF.1) / MFPlus":
- 297 **SFP 7: MFPlus Access Control Policy**
- The Security Function Policy (SFP) MFPlus Access Control Policy uses the following definitions:*
- The following roles are supported:*
- *The Personaliser who can personalise the TOE.*
 - *The Card Administrator who can change security attributes which do not require being changed in the field.*
 - *The Card Manager who can change security attributes which may require being changed in the field.*
 - *The Card Security Level Manager who can switch the card to a higher security level.*
 - *The Card User who can perform operations with blocks.*
 - *The Originality Key User who can authenticate himself to prove the authenticity of the Card.*
- Note that multiple subjects may have the same role, e.g. for every sector there are two Card Users (identified by the respective "Key A" and "Key B" for this sector). The assigned rights to the Card Users can be different, which allows having more or less powerful Card Users. There are also more than one Originality Key User and Card Security Level Manager.*
- Any other subject belongs to the role Anybody which is not modelled explicitly in the policy because no access rights are granted to this role. This role includes the card holder (i.e. end-user) and any other subject e.g. an attacker.*
- The objects are:*
- *blocks that are grouped in sectors. Each sector consists of either 4 or 16 blocks. One block of each sector contains the access conditions and is called Sector Trailer. One specific type of data stored in a block is a value.*
- The operations that can be performed with the objects are:*
- *read data from a block,*
 - *write data to a block,*
 - *increase, decrease, transfer or restore a value and*
 - *read or modify the security attributes.*

The security attributes are:

- the MFP Configuration Block,
- the Field Configuration Block,
- the sector trailer for a sector and
- the security level of the TOE.

Note that subjects are authorised by cryptographic keys. These keys are considered as authentication data and not as security attributes. The TOE stores a dedicated cryptographic key for every subject. The key of the Card Administrator is called "Card Master Key" and the key for the Card Manager is called "Card Configuration Key". The Card Security Level Manager keys are called "Level 2 Switch Key" and "Level 3 Switch Key". The keys of the Card Users are called "AES Sector Keys". Since there are two keys for every sector the keys are called "AES Sector Key A" and "AES Sector Key B" or in short "Key A" and "Key B". The keys of the Originality Key User are called "Originality Keys".

Implications of the MFPlus Access Control Policy:

The MFPlus Access Control Policy has some implications, that can be drawn from the policy and that are essential parts of the TOE security functions.

- The TOE end-user does normally not belong to the group of authorised users (Card Administrator, Card Manager, Card Security Level Manager, Card User, Originality Key User), but is regarded as 'Anybody' by the TOE. This means that the TOE cannot determine if it is used by its intended end-user (in other words: it cannot determine if the current card holder is the owner of the card).
- The Personaliser is very powerful, although the role is limited to Security Level 0. The Personaliser can write all blocks and therefore change all data and the sector trailers.
- Switching of the security level is an integral part of the TOE security. The TOE is switched from security level 0 to security level 1 or 3 at the end of the personalisation phase. The security level can be increased by the Card Security Level Manager afterwards.

Static attribute initialisation (FMT_MSA.3) / MFPlus

- 298 The TSF shall enforce the **MFPlus Access Control Policy** to provide **permissive** default values for security attributes that are used to enforce the SFP.
- 299 The TSF shall allow **no subject** to specify alternative initial values to override the default values when an object or information is created.

Management of security attributes (FMT_MSA.1) / MFPlus

- 300 The TSF shall enforce the **MFPlus Access Control Policy** to restrict the ability to **modify** the security attributes **MFP Configuration Block, Field Configuration Block, security level and sector trailers** to the **Card Administrator, Card Manager, Card Security Level Manager and Card User, respectively**.

Specification of Management Functions (FMT_SMF.1) / MFPlus

- 301 The TSF shall be capable of performing the following security management functions:
- **Authenticate a user,**
 - **Invalidating the current authentication state based on the functions: Issuing a request for authentication, Occurrence of any error during the execution of a**

command, Reset, Switching the security level of the TOE, DESELECT according to ISO 14443-3, explicit authentication request;

- *Finishing the personalisation phase by explicit request of the Personaliser,*
- *Changing a security attribute.*
- *Selection and Deselection of the virtual card.*

Import of user data with security attributes (FDP_ITC.2) / MFPlus

- 302 The TSF shall enforce the **MFPlus Access Control Policy** when importing user data, controlled under the SFP, from outside of the TOE.
- 303 The TSF shall use the security attributes associated with the imported user data.
- 304 The TSF shall ensure that the protocol used provides for the unambiguous association between the security attributes and the user data received.
- 305 The TSF shall ensure that interpretation of the security attributes of the imported user data is as intended by the source of the user data.
- 306 The TSF shall enforce the following rules when importing user data controlled under the SFP from outside the TOE: **no additional rules**.

Inter-TSF basic TSF data consistency (FPT_TDC.1) / MFPlus

- 307 The TSF shall provide the capability to consistently interpret **data blocks** when shared between the TSF and another trusted IT product.
- 308 The TSF shall use **the rules: data blocks can always be modified by the write operation. If a data block is in the value format it can be modified by all dedicated value-specific operations honouring the value-specific boundaries. Sector trailers must have a specific format** when interpreting the TSF data from another trusted IT product.
- Application note:
The TOE does not interpret the contents of the data, e.g. it cannot determine if data stored in a specific block is an identification number that adheres to a specific format. Instead, the TOE distinguishes different types of blocks and ensures that type-specific boundaries cannot be violated, e.g. values do not overflow. For sector trailers the TOE enforces a specific format.

Cryptographic key destruction (FCS_CKM.4) / MFPlus

- 309 The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method **overwriting of memory** that meets the following: **none**.

User identification before any action (FIA_UID.2) / MFPlus

- 310 The TSF shall require each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.
- Application note:
Identification of a user is performed upon an authentication request based on the key block number. For example, if an authentication request for key number 0x9000 is issued after selecting the Card, the user is identified as the Card Administrator.

User authentication before any action (FIA_UAU.2) / MFPlus

- 311 The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

Multiple authentication mechanisms (FIA_UAU.5) / MFPlus

- 312 The TSF shall provide '*none*' and *cryptographic authentication* to support user authentication.
- 313 The TSF shall authenticate any user's claimed identity according to the **following rules**:
- **The '*none*' authentication is performed with anyone who communicates with the TOE in security level 0. The '*none*' authentication implicitly and solely authorises the Personaliser subject.**
 - **The cryptographic authentication is used in security level 0 to authenticate the Originality Key User.**
 - **The cryptographic authentication is used in security level 1 to authenticate the Originality Key User and the Card Security Level Manager.**
 - **The cryptographic authentication is used in security level 2 to authenticate the Originality Key User, Card Administrator, Card Manager and the Card Security Level Manager.**
 - **The cryptographic authentication is used in security level 3 to authenticate the Originality Key User, Card Administrator, Card Manager and the Card User.**

Management of TSF data (FMT_MTD.1) / MFPlus

- 314 The TSF shall restrict the ability to **modify** the **security attributes and authentication data** to **the Personaliser, Card Administrator, Card Manager, Card Security Level Manager and Card User**.
- 315 **Refinement:**
- The detailed management abilities are:**
- **The Personaliser can change all security attributes as well as all keys except the keys of the Originality Key User.**
 - **The Card Administrator can change the MFP Configuration Block, the Card Master Key and the Level 3 Switch Key. The latter only in Security Level 2.**
 - **The Card Manager can change the Field Configuration Block and the Card Configuration Key.**
 - **The Card Security Level Manager can switch the security level of the TOE to a higher level.**
 - **The Card User may change the AES Sector Keys and the sector trailer if the access conditions in the corresponding sector trailer grants him this right.**

Trusted path (FTP_TRP.1) / MFPlus

- 316 The TSF shall provide a communication path between itself and **remote** users that is logically distinct from other communication paths and provides assured identification of its end points and protection of the communicated data from **modification or disclosure**.
- 317 The TSF shall permit **remote users** to initiate communication via the trusted path.

318 The TSF shall require the use of the trusted path for **authentication requests, confidentiality and/or data integrity verification for data transfers based on a setting in the MFP Configuration Block**.

Replay detection (FPT_RPL.1) / MFPlus

319 The TSF shall detect replay for the following entities: **authentication requests, confidentiality and/or data integrity verification for data transfers based on a setting in the MFP Configuration Block**.

320 The TSF shall perform **rejection of the request** when replay is detected.

Unlinkability (FPR_UNL.1) / MFPlus

321 The TSF shall ensure that **unauthorised subjects other than the card holder** are unable to determine whether **any operation of the TOE were caused by the same user**.

Minimum and maximum quotas (FRU_RSA.2) / MFPlus

322 The TSF shall enforce maximum quotas of the following resources **NVM and RAM** that **subjects** can use **simultaneously**.

323 The TSF shall ensure the provision of minimum quantity of **the NVM and the RAM** that is available for **subjects** to use **simultaneously**.

Application note:

The subjects addressed here are MFPlus, and all other applications running on the TOE. The goal is to ensure that MFPlus always have enough NVM and RAM for its own usage.

Subset residual information protection (FDP_RIP.1) / MFPlus

324 The TSF shall ensure that any previous information content of a resource is made unavailable upon the **deallocation of the resource from** the following objects: **MFPlus**.

5.1.6 Additional Security Functional Requirements related to DESFire

325 The following SFRs are extensions to "[BSI-CC-PP-0084-2014](#)" Protection Profile (PP), related to the capabilities and protections of DESFire.

326 They are only valid in case **DESFire** is embedded.

327 **Note:** MIFARE DESFire EV1 library directly relies upon the following IC SFRs:

- FRU_FLT.2 in providing services as part of the security countermeasures implemented in the library,
- FPT_FLS.1 in order to generate a software reset,
- FCS_RNG.1 for the provision of random numbers,
- FCS_COP.1 / TDES for DES cryptographic operations,
- FCS_COP.1 / AES for AES cryptographic operations.

328 It also relies upon the other SFRs (except those of NesLib), which provide general low level security mechanisms.

Security roles (FMT_SMR.1) / DESFire

329 The TSF shall maintain the roles **Administrator, Application Manager, Application User and Everybody**.

330 The TSF shall be able to associate users with roles.

331 **Note:** Based on the definition, Nobody is not considered as a role.

Subset access control (FDP_ACC.1) / DESFire

332 The TSF shall enforce the **DESFire Access Control Policy** on *all subjects, objects, operations and attributes defined by the DESFire Access Control Policy*.

Security attribute based access control (FDP_ACF.1) / DESFire

333 The TSF shall enforce the **DESFire Access Control Policy** to objects based on the following: *all subjects, objects and attributes*.

334 The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:

- *The Administrator can create and delete applications.*
- *The Application Manager of an application can delete this application, create data files and values within this application, delete data files and values within this application.*
- *An Application User can read or write a data file; read, increase or decrease a value based on the access control settings in the respective file attribute.*

335 The TSF shall explicitly authorise access of subjects to objects based on the following additional rules:

- *Everybody can create applications if this is allowed by a specific card attribute.*
- *Everybody can create and delete data files or values of a specific application if this is allowed by a specific application attribute.*
- *Everybody can read or write a data file; read, increase or decrease a value if this is allowed by a specific file attribute.*

336 The TSF shall explicitly deny access of subjects to objects based on the following additional rules:

- *Nobody can read or write a data file; read, increase or decrease a value if this is explicitly set for the respective operation on the respective data file or value.*

337 The following SFP **DESFire Access Control Policy** is defined for the requirement "Security attribute based access control (FDP_ACF.1) / DESFire":

338 SFP_8: DESFire Access Control Policy

The Security Function Policy (SFP) DESFire Access Control Policy uses the following definitions:

The subjects are:

- *The Administrator i.e. the subject that owns or has access to the card master key.*
- *The Application Manager i.e. the subject that owns or has access to an application master key. Note that the TOE supports multiple applications and therefore multiple Application Managers, however for one application there is only one Application Manager.*
- *The Application User i.e. the subject that owns or has access to a key that allows to perform operations with application objects. Note that the TOE supports multiple*

Application Users within each application and the assigned rights to the Application Users can be different, which allows to have more or less powerful Application Users.

- *Any other subject belongs to the role Everybody. This includes the card holder (i.e. end-user) and any other subject e.g. an attacker. These subjects do not possess any key and can not perform operations that are restricted to the Administrator, Application Manager and Application User.*
- *The term Nobody will be used to explicitly indicate that no rights are granted to any subject.*

The objects are:

- *The Card itself.*
- *The card can store a number of Applications.*
- *An application can store a number of Data Files of different types.*
- *One specific type of data file are Values.*

Note that data files and values can be grouped in standard files and backup files, with values belonging to the group of backup files. When the term "file" is used without further information then both data files and values are meant.

The operations that can be performed with the objects are:

- *read a value or data from a data file,*
- *write data to a data file,*
- *increase a value (with a limit or unlimited),*
- *decrease a value,*
- *create an application, a value or a data file,*
- *delete an application, a value or a data file and*
- *modify attribute of the card, an application, a value or a data file. Note that 'freeze' will be used as specific form of modification that prevents any further modify.*

The security attributes are:

- *Attributes of the card, applications, values and data files.*
There is a set of attributes for the card, a set of attributes for every application and a set of attributes for every single file within an application.
The term "card attributes" will be used for the set of attributes related to the card, the term "application attributes" will be used for the set of application attributes and the term "file attributes" will be used for the attributes of values and data files.

Note that subjects are authorised by cryptographic keys. These keys are considered as authentication data and not as security attributes. The card has a card master key. Every application has an application master key and a variable number of keys used for operations on data files or values (all these keys are called application keys). The application keys within an application are numbered.

Implications of the DESFire Access Control Policy:

The DESFire Access Control Policy has some implications, that can be drawn from the policy and that are essential parts of the TOE security functions.

- *The TOE end-user does normally not belong to the group of authorised users (Administrator, Application Manager, Application User), but regarded as 'Everybody' by the TOE. This means that the TOE cannot determine if it is used by its intended end-*

user (in other words: it cannot determine if the current card holder is the owner of the card).

- The Administrator can have the exclusive right to create and delete applications on the Smart Card, however he can also grant this privilege to Everybody. Additionally, changing the Smart Card attributes is reserved for the Administrator. Application keys, at delivery time should be personalized to a preliminary, temporary key only known to the Administrator and the Application Manager.
- At application personalization time, the Application Manager uses the preliminary application key in order to personalize the application keys, whereas all keys, except the application master key, can be personalized to a preliminary, temporary key only known to the Application Manager and the Application User. Furthermore, the Application Manager has the right to create files within his application scope.

Static attribute initialisation (FMT_MSA.3) / DESFire

339 The TSF shall enforce the **DESFire Access Control Policy** to provide **permissive** default values for security attributes that are used to enforce the SFP.

340 The TSF shall allow **no subject** to specify alternative initial values to override the default values when an object or information is created.

341 Application note:

The only initial attributes are the card attributes. All other attributes have to be defined at the same time the respective object is created.

Management of security attributes (FMT_MSA.1) / DESFire

342 The TSF shall enforce the **DESFire Access Control Policy** to restrict the ability to **modify or freeze** the security attributes **card attributes, application attributes and file attributes** to the **Administrator, Application Manager and Application User, respectively**.

343 **Refinement:**

The detailed management abilities are:

- **The Administrator can modify the card attributes. The card attributes contain a flag that when set will prevent any further change of the card attributes, thereby allowing to freeze the card attributes.**
- **The Application Manager can modify the application attributes. The application attributes contain a flag that when set will prevent any further change of the application attributes, thereby allowing to freeze the application attributes.**
- **The Application Manager can decide to restrict the ability to modify the file attributes to the Application Manager, an Application User, Everybody or to Nobody. The restriction to Nobody is equivalent to freezing the file attributes.**
- **As an implication of the last rule, any subject that receives the modify abilities from the Application Manager gets these abilities transferred.**
- **The implication given in the previous rule includes the possibility for an Application User to modify the file attributes if the Application Manager decides to transfer this ability. If there is no such explicit transfer an Application User does not have the ability to modify the file attributes.**

Specification of Management Functions (FMT_SMF.1) / DESFire

344 The TSF shall be capable of performing the following security management functions:

- **Authenticating a user,**
- **Invalidating the current authentication state based on the functions: Selecting an application or the card, Changing a key, Occurrence of any error during the execution of a command, Reset,**
- **Changing a security attribute,**
- **Creating or deleting an application, a value or a data file.**

Import of user data with security attributes (FDP_ITC.2) / DESFire

345 The TSF shall enforce the **DESFire Access Control Policy** when importing user data, controlled under the SFP, from outside of the TOE.

346 The TSF shall use the security attributes associated with the imported user data.

347 The TSF shall ensure that the protocol used provides for the unambiguous association between the security attributes and the user data received.

348 The TSF shall ensure that interpretation of the security attributes of the imported user data is as intended by the source of the user data.

349 The TSF shall enforce the following rules when importing user data controlled under the SFP from outside the TOE: **no additional rules**.

Inter-TSF basic TSF data consistency (FPT_TDC.1) / DESFire

350 The TSF shall provide the capability to consistently interpret **data files and values** when shared between the TSF and another trusted IT product.

351 The TSF shall use **the rule: data files or values can only be modified by their dedicated type-specific operations honouring the type-specific boundaries** when interpreting the TSF data from another trusted IT product.

Application note:

The TOE does not interpret the contents of the data, e.g. it can not determine if data stored in a specific data file is an identification number that adheres to a specific format. Instead the TOE distinguishes different types of files and ensures that type-specific boundaries can not be violated, e.g. values do not overflow, single records are limited by their size and cyclic records are handled correctly.

Cryptographic key destruction (FCS_CKM.4) / DESFire

352 The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method **overwriting of memory** that meets the following: **none**.

User identification before any action (FIA_UID.2) / DESFire

353 The TSF shall require each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.

Application note:

Identification of a user is performed upon an authentication request based on the currently selected context and the key number. For example, if an authentication request for key number 0 is issued after selecting a specific application, the user is identified as the Application Manager of the respective application. Before any authentication request is issued, the user is identified as 'Everybody'.

User authentication before any action (FIA_UAU.2) / DESFire

- 354 The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

Multiple authentication mechanisms (FIA_UAU.5) / DESFire

- 355 The TSF shall provide '*none*' and *cryptographic authentication* to support user authentication.
- 356 The TSF shall authenticate any user's claimed identity according to the *following rules*:
- *The 'none' authentication is performed with anyone who communicates with the TOE without issuing an explicit authentication request. The 'none' authentication implicitly and solely authorises the 'Everybody' subject.*
 - *The cryptographic authentication is used to authorise the Administrator, Application Manager and Application User.*

Management of TSF data (FMT_MTD.1) / DESFire

- 357 The TSF shall restrict the ability to *change default, modify or freeze* the *card master key, application master keys and application keys* to the *Administrator, Application Manager and Application User*.

358 *Refinement:*

The detailed management abilities are:

- *The Administrator can modify the card master key. The card attributes contain a flag that when set will prevent any further change of the card master key, thereby allowing to freeze the card master key.*
- *The Administrator can change the default key that is used for the application master key and for the application keys when an application is created.*
- *The Application Manager of an application can modify the application master key of this application. The application attributes contain a flag that when set will prevent any further change of the application master key, thereby allowing to freeze the application master key.*
- *The Application Manager can decide to restrict the ability to modify the application keys to the Application Manager, the Application Users or to Nobody. The restriction to Nobody is equivalent to freezing the application keys. The Application Users can either change their own keys or one Application User can be defined that can change all keys of the Application Users within an application.*
- *As an implication of the last rule, any subject that receives the modify abilities from the Application Manager gets these abilities transferred.*

Trusted path (FTP_TRP.1) / DESFire

- 359 The TSF shall provide a communication path between itself and *remote* users that is logically distinct from other communication paths and provides assured identification of its end points and protection of the communicated data from *modification or disclosure*.
- 360 The TSF shall permit *remote users* to initiate communication via the trusted path.
- 361 The TSF shall require the use of the trusted path for *authentication requests with DES and AES, confidentiality and/or data integrity verification for data transfers protected with AES and based on a setting in the file attributes*.

Basic rollback (FDP_ROL.1) / DESFire

- 362 The TSF shall enforce *the DESFire Access Control Policy* to permit the rollback of the *operations that modify the value or data file objects* on the *backup files*.
- 363 The TSF shall permit operations to be rolled back within the *scope of the current transaction, which is defined by the following limitative events: chip reset, (re-) authentication (either successful or not), select command, explicit commit, explicit abort, command failure*.

Replay detection (FPT_RPL.1) / DESFire

- 364 The TSF shall detect replay for the following entities: *authentication requests with DES and AES, confidentiality and/or data integrity verification for data transfers protected with AES and based on a setting in the file attributes*.
- 365 The TSF shall perform *rejection of the request* when replay is detected.

Unlinkability (FPR_UNL.1) / DESFire

- 366 The TSF shall ensure that *unauthorised subjects other than the card holder* are unable to determine whether *any operation of the TOE were caused by the same user*.

Minimum and maximum quotas (FRU_RSA.2) / DESFire

- 367 The TSF shall enforce maximum quotas of the following resources *NVM and RAM* that *subjects* can use *simultaneously*.
- 368 The TSF shall ensure the provision of minimum quantity of *the NVM and the RAM* that is available for *subjects* to use *simultaneously*.
- Application note:
The subjects addressed here are DESFire, and all other applications running on the TOE.
The goal is to ensure that DESFire always have enough NVM and RAM for its own usage.

Subset residual information protection (FDP_RIP.1) / DESFire

- 369 The TSF shall ensure that any previous information content of a resource is made unavailable upon the *deallocation of the resource from* the following objects: *DESFire*.

5.1.7 Additional Security Functional Requirements common to DESFire and MFPlus**Subset access control (FDP_ACC.1) / APPLI_FWL**

- 370 The TSF shall enforce the *Protected Application Firewall Access Control Policy* on the *Protected Application code and data*.

Security attribute based access control (FDP_ACF.1) / APPLI_FWL

- 371 The TSF shall enforce the *Protected Application Firewall Access Control Policy* to objects based on the following: *Protected Application code and data*.
- 372 The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: *An application cannot read, write, compare any piece of data or code belonging to the Protected Application*.

- 373 The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: **None**.
- 374 The TSF shall explicitly deny access of subjects to objects based on the following additional rules:
- **Another application cannot read, write, compare any piece of data or code belonging to the Protected Application.**
- 375 The following SFP **Protected Application Firewall Access Control Policy** is defined for the requirement "Security attribute based access control (FDP_ACF.1) / APPLI_FWL":
- 376 SFP_9: Protected Application Firewall Access Control Policy
- 377 *Another application cannot read, write, compare any piece of data or code belonging to the Protected Application.*
- Application Note:
One only application can be protected by the LPU. DESFire and/or MFPlus is the only Protected Application, when they are embedded.
- Static attribute initialisation (FMT_MSA.3) / APPLI_FWL**
- 378 The TSF shall enforce the **Protected Application Firewall Access Control Policy** to provide **restrictive** default values for security attributes that are used to enforce the SFP.
- 379 The TSF shall allow **no subject** to specify alternative initial values to override the default values when an object or information is created.

5.2 TOE security assurance requirements

- 380 Security Assurance Requirements for the TOE for the evaluation of the TOE are those taken from the Evaluation Assurance Level **5** (EAL5) and augmented by taking the following components:
- **ADV_IMP.2, ADV_INT.3, ADV_TDS.5, ALC_CMC.5, ALC_DVS.2, ALC_FLR.1, ALC_TAT.3, ASE_TSS.2, ATE_COV.3, ATE_FUN.2 and AVA_VAN.5.**
- 381 Regarding application note 21 of [BSI-CC-PP-0084-2014](#), the continuously increasing maturity level of evaluations of Security ICs justifies the selection of a higher-level assurance package.
- 382 The component ALC_FLR.1 is chosen as an augmentation in this ST because a solid flaw management is key for the continuous improvement of the security IC platforms, especially on markets which need highly resistant and long lasting products.
- 383 The component ASE_TSS.2 is chosen as an augmentation in this ST to give architectural information on the security functionality of the TOE.
- 384 The set of security assurance requirements (SARs) is presented in [Table 10](#), indicating the origin of the requirement.

Table 10. TOE security assurance requirements

Label	Title	Origin
ADV_ARC.1	Security architecture description	EAL5/ BSI-CC-PP-0084-2014
ADV_FSP.5	Complete semi-formal functional specification with additional error information	EAL5

Table 10. TOE security assurance requirements (continued)

Label	Title	Origin
ADV_IMP.2	Complete mapping of the implementation representation of the TSF	Security Target
ADV_INT.3	Minimally complex internals	Security Target
ADV_TDS.5	Complete semiformal modular design	Security Target
AGD_OPE.1	Operational user guidance	EAL5/ BSI-CC-PP-0084-2014
AGD_PRE.1	Preparative procedures	EAL5/ BSI-CC-PP-0084-2014
ALC_CMC.5	Advanced support	Security Target
ALC_CMS.5	Development tools CM coverage	EAL5
ALC_DEL.1	Delivery procedures	EAL5/ BSI-CC-PP-0084-2014
ALC_DVS.2	Sufficiency of security measures	BSI-CC-PP-0084-2014
ALC_FLR.1	Basic flaw remediation	Security Target
ALC_LCD.1	Developer defined life-cycle model	EAL5/ BSI-CC-PP-0084-2014
ALC_TAT.3	Compliance with implementation standards - all parts	Security Target
ASE_CCL.1	Conformance claims	EAL5/ BSI-CC-PP-0084-2014
ASE_ECD.1	Extended components definition	EAL5/ BSI-CC-PP-0084-2014
ASE_INT.1	ST introduction	EAL5/ BSI-CC-PP-0084-2014
ASE_OBJ.2	Security objectives	EAL5/ BSI-CC-PP-0084-2014
ASE_REQ.2	Derived security requirements	EAL5/ BSI-CC-PP-0084-2014
ASE_SPD.1	Security problem definition	EAL5/ BSI-CC-PP-0084-2014
ASE_TSS.2	TOE summary specification	Security Target
ATE_COV.3	Rigorous analysis of coverage	Security Target
ATE_DPT.3	Testing: modular design	EAL5
ATE_FUN.2	Ordered functional testing	Security Target
ATE_IND.2	Independent testing - sample	EAL5/ BSI-CC-PP-0084-2014
AVA_VAN.5	Advanced methodical vulnerability analysis	BSI-CC-PP-0084-2014

5.3 Refinement of the security assurance requirements

- 385 As [BSI-CC-PP-0084-2014](#) defines refinements for selected SARs, these refinements are also claimed in this Security Target.
- 386 The main customizing is that the IC Dedicated Software is an operational part of the TOE after delivery, although it is mainly not available to the user.
- 387 Regarding application note 22 of [BSI-CC-PP-0084-2014](#), the refinements for all the assurance families have been reviewed for the hierarchically higher-level assurance components selected in this Security Target, and a refinement on ADV_SPM has been added.

- 388 The text of the impacted refinements of [BSI-CC-PP-0084-2014](#) is reproduced in the next sections.
- 389 For reader's ease, an impact summary is provided in [Table 11](#).

Table 11. Impact of EAL5 selection on [BSI-CC-PP-0084-2014](#) refinements

Assurance Family	BSI-CC-PP-0084-2014 Level	ST Level	Impact on refinement
ADO_DEL	1	1	None
ALC_DVS	2	2	None
ALC_CMS	4	5	None, refinement is still valid
ALC_CMC	4	5	None, refinement is still valid
ADV_ARC	1	1	None
ADV_FSP	4	5	Presentation style changes, IC Dedicated Software is included
ADV_IMP	1	2	None, refinement is still valid
ATE_COV	2	3	IC Dedicated Software is included
AGD_OPE	1	1	None
AGD_PRE	1	1	None
AVA_VAN	5	5	None

5.3.1 Refinement regarding functional specification (ADV_FSP)

- 390 ~~Although the IC Dedicated Test Software is a part of the TOE, the test functions of the IC Dedicated Test Software are not described in the Functional Specification because the IC Dedicated Test Software is considered as a test tool delivered with the TOE but not providing security functions for the operational phase of the TOE. The IC Dedicated Software provides security functionalities as soon as the TOE becomes operational (boot software). These are properly identified in the delivered documentation.~~
- 391 The Functional Specification **refers to datasheet to** trace security features that do not provide any external interface but that contribute to fulfil the SFRs e.g. like physical protection. Thereby they are part of the complete instantiation of the SFRs.
- 392 The Functional Specification **refers to design specifications to detail the** mechanisms against physical attacks **described** in a more general way only, but detailed enough to be able to support Test Coverage Analysis also for those mechanisms where inspection of the layout is of relevance or tests beside the TSFI may be needed.
- 393 The Functional Specification **refers to data sheet to** specify operating conditions of the TOE. These conditions include but are not limited to the frequency of the clock, the power supply, and the temperature.
- 394 All functions and mechanisms which control access to the functions provided by the IC Dedicated Test Software (refer to the security functional requirement (FMT_LIM.2)) **are part of the** Functional Specification. Details will be given in the document for ADV_ARC, ~~refer to Section 6.2.1.5.~~ In addition, all these functions and mechanisms **are** subsequently be

refined according to all relevant requirements of the Common Criteria assurance class ADV because these functions and mechanisms are active after TOE Delivery and need to be part of the assurance aspects Tests (class ATE) and Vulnerability Assessment (class AVA). Therefore, all necessary information **is** provided to allow tests and vulnerability assessment.

- 395 Since the selected higher-level assurance component requires a security functional specification presented in a “semi-formal style” (ADV_FSP.5.2C) the changes affect the style of description, the [BSI-CC-PP-0084-2014](#) refinements can be applied with changes covering the IC Dedicated Test Software and are valid for ADV_FSP.5.

5.3.2 Refinement regarding test coverage (ATE_COV)

- 396 The TOE **is** tested under different operating conditions within the specified ranges. These conditions include but are not limited to the frequency of the clock, the power supply, and the temperature. This means that “Fault tolerance (FRU_FLT.2)” **is** proven for the complete TSF. The tests ~~must~~ also cover functions which may be affected by “ageing” (such as EEPROM writing).
- 397 The existence and effectiveness of measures against physical attacks (as specified by the functional requirement FPT_PHP.3) cannot be tested in a straightforward way. Instead **STMicroelectronics provides** evidence that the TOE actually has the particular physical characteristics (especially layout design principles). This **is** done by checking the layout (implementation or actual) in an appropriate way. The required evidence pertains to the existence of mechanisms against physical attacks (unless being obvious).
- 398 ~~The IC Dedicated Test Software is seen as a “test tool” being delivered as part of the TOE. However, the Test Features do not provide security functionality. Therefore, Test Features need not to be covered by the Test Coverage Analysis but all functions and mechanisms which limit the capability of the functions (cf. FMT_LIM.1) and control access to the functions (cf. FMT_LIM.2) provided by the IC Dedicated Test Software must be part of the Test Coverage Analysis.~~ **The IC Dedicated Software provides security functionalities as soon as the TOE becomes operational (boot software). These are part of the Test Coverage Analysis.**

5.4 Security Requirements rationale

5.4.1 Rationale for the Security Functional Requirements

- 399 Just as for the security objectives rationale of [Section 4.3](#), the main line of this rationale is that the inclusion of all the security requirements of the [BSI-CC-PP-0084-2014](#) protection profile, together with those in [AUG](#), and with those introduced in this Security Target, guarantees that all the security objectives identified in [Section 4](#) are suitably addressed by the security requirements stated in this chapter, and that the latter together form an internally consistent whole.

Table 12. Security Requirements versus Security Objectives

Security Objective	TOE Security Functional and Assurance Requirements
<i>BSI.O.Leak-Inherent</i>	<i>Basic internal transfer protection FDP_ITT.1</i> <i>Basic internal TSF data transfer protection FPT_ITT.1</i> <i>Subset information flow control FDP_IFC.1</i>
<i>BSI.O.Phys-Probing</i>	<i>Stored data confidentiality FDP_SDC.1</i> <i>Resistance to physical attack FPT_PHP.3</i>
<i>BSI.O.Malfunction</i>	<i>Limited fault tolerance FRU_FLT.2</i> <i>Failure with preservation of secure state FPT_FLS.1</i>

400 As origins of security objectives have been carefully kept in their labelling, and origins of security requirements have been carefully identified in [Table 7](#) and [Table 12](#), it can be

- verified that the justifications provided by the [BSI-CC-PP-0084-2014](#) protection profile and [AUG](#) can just be carried forward to their union.
- 401 From [Table 5](#), it is straightforward to identify additional security objectives for the TOE ([AUG1.O.Add-Functions](#) and [AUG4.O.Mem-Access](#)) tracing back to [AUG](#), and additional objectives ([O.Controlled-ES-Loading](#), [O.Access-Control-MFPlus](#), [O.Authentication-MFPlus](#), [O.Encryption](#), [O.MAC-MFPlus](#), [O.Type-Consistency-MFPlus](#), [O.No-Trace-MFPlus](#), [O.Resp-Appl-MFPlus](#), [O.Resource-MFPlus](#), [O.Verification-MFPlus](#), [O.Firewall-MFPlus](#), [O.Shr-Var-MFPlus](#), [O.Access-Control-DESEFire](#), [O.Authentication-DESEFire](#), [O.Confidentiality-DESEFire](#), [O.Type-Consistency-DESEFire](#), [O.Transaction-DESEFire](#), [O.No-Trace-DESEFire](#), [O.Resp-Appl-DESEFire](#), [O.Resource-DESEFire](#), [O.Verification-DESEFire](#), [O.Firewall-DESEFire](#) and [O.Shr-Res-DESEFire](#)) introduced in this Security Target. This rationale must show that security requirements suitably address them all.
- 402 Furthermore, a careful observation of the requirements listed in [Table 7](#) and [Table 12](#) shows that:
- there are security requirements introduced from [AUG](#) ([FCS_COP.1](#), [FDP_ACC.2 / Memories](#), [FDP_ACF.1 / Memories](#), [FMT_MSA.3 / Memories](#) and [FMT_MSA.1 / Memories](#)),
 - there are additional security requirements introduced by this Security Target ([FCS_CKM.1](#), [FDP_ITC.1 / Loader](#), [FDP_ACC.1 / Loader](#), [FDP_ACF.1 / Loader](#), [FMT_MSA.3 / Loader](#), [FMT_MSA.1 / Loader](#), [FMT_SMF.1 / Loader](#), [FMT_SMR.1 / Loader](#), [FIA_UID.1 / Loader](#), [FMT_SMF.1 / Memories](#), [FMT_SMR.1 / MFPlus](#), [FDP_ACC.1 / MFPlus](#), [FDP_ACF.1 / MFPlus](#), [FMT_MSA.3 / MFPlus](#), [FMT_MSA.1 / MFPlus](#), [FMT_SMF.1 / MFPlus](#), [FDP_ITC.2 / MFPlus](#), [FPT_TDC.1 / MFPlus](#), [FIA_UID.2 / MFPlus](#), [FIA_UAU.2 / MFPlus](#), [FIA_UAU.5 / MFPlus](#), [FMT_MTD.1 / MFPlus](#), [FPT_TRP.1 / MFPlus](#), [FCS_CKM.4 / MFPlus](#), [FPT_RPL.1 / MFPlus](#), [FPR_UNL.1 / MFPlus](#), [FRU_RSA.2 / MFPlus](#), [FDP_RIP.1 / MFPlus](#), [FMT_SMR.1 / DESEFire](#), [FDP_ACC.1 / DESEFire](#), [FDP_ACF.1 / DESEFire](#), [FMT_MSA.3 / DESEFire](#), [FMT_MSA.1 / DESEFire](#), [FMT_SMF.1 / DESEFire](#), [FDP_ITC.2 / DESEFire](#), [FPT_TDC.1 / DESEFire](#), [FIA_UID.2 / DESEFire](#), [FIA_UAU.2 / DESEFire](#), [FIA_UAU.5 / DESEFire](#), [FMT_MTD.1 / DESEFire](#), [FPT_TRP.1 / DESEFire](#), [FCS_CKM.4 / DESEFire](#), [FDP_ROL.1 / DESEFire](#), [FPT_RPL.1 / DESEFire](#), [FPR_UNL.1 / DESEFire](#), [FRU_RSA.2 / DESEFire](#), [FDP_RIP.1 / DESEFire](#), [FDP_ACC.1 / APPLI_FWL](#), [FDP_ACF.1 / APPLI_FWL](#), and [FMT_MSA.3 / APPLI_FWL](#), and various assurance requirements of EAL5+).
- 403 Though it remains to show that:
- security objectives from this Security Target and from [AUG](#) are addressed by security requirements stated in this chapter,
 - additional security requirements from this Security Target and from [AUG](#) are mutually supportive with the security requirements from the [BSI-CC-PP-0084-2014](#) protection profile, and they do not introduce internal contradictions,
 - all dependencies are still satisfied.
- 404 The justification that the additional security objectives are suitably addressed, that the additional security requirements are mutually supportive and that, together with those already in [BSI-CC-PP-0084-2014](#), they form an internally consistent whole, is provided in the next subsections.

5.4.2 Additional security objectives are suitably addressed

Security objective “Dynamic Area based Memory Access Control (*AUG4.O.Mem-Access*)”

- 405 The justification related to the security objective “*Dynamic* Area based Memory Access Control (*AUG4.O.Mem-Access*)” is as follows:
- 406 The security functional requirements “*Complete access control (FDP_ACC.2) / Memories*” and “*Security attribute based access control (FDP_ACF.1) / Memories*”, with the related Security Function Policy (SFP) “*Dynamic Memory Access Control Policy*” exactly require to implement a *Dynamic* area based memory access control as demanded by *AUG4.O.Mem-Access*. Therefore, *FDP_ACC.2 / Memories* and *FDP_ACF.1 / Memories* with *their* SFP are suitable to meet the security objective.
- 407 The security functional requirement “*Static attribute initialisation (FMT_MSA.3) / Memories*” requires that the TOE provides default values for security attributes. The ability to update the security attributes is restricted to privileged subject(s) *as further detailed in the security functional requirement “Management of security attributes (FMT_MSA.1) / Memories”*. These management functions ensure that the required access control can be realised using the functions provided by the TOE.

Security objective “Additional Specific Security Functionality (*AUG1.O.Add-Functions*)”

- 408 The justification related to the security objective “Additional Specific Security Functionality (*AUG1.O.Add-Functions*)” is as follows:
- 409 The security functional requirements “*Cryptographic operation (FCS_COP.1)*” and “*Cryptographic key generation (FCS_CKM.1)*” exactly require those functions to be implemented that are demanded by *AUG1.O.Add-Functions*. Therefore, *FCS_COP.1* is suitable to meet the security objective, *together with FCS_CKM.1*.

Security objective “Controlled loading of the Security IC Embedded Software (*O.Controlled-ES-Loading*)”

- 410 The justification related to the security objective “Controlled loading of the Security IC Embedded Software (*O.Controlled-ES-Loading*)” is as follows:
- 411 The security functional requirements “*Import of user data without security attributes (FDP_ITC.1) / Loader*”, “*Subset access control (FDP_ACC.1) / Loader*” and “*Security attribute based access control (FDP_ACF.1) / Loader*”, with the related Security Function Policy (SFP) “*Loading Access Control Policy*” exactly require to implement a controlled loading of the Security IC Embedded Software as demanded by *O.Controlled-ES-Loading*. Therefore, *FDP_ITC.1 / Loader*, *FDP_ACC.1 / Loader* and *FDP_ACF.1 / Loader* with their SFP are suitable to meet the security objective.
- 412 The security functional requirement “*Static attribute initialisation (FMT_MSA.3) / Loader*” requires that the TOE provides default values for security attributes. The ability to update the security attributes is restricted to privileged subject(s) as further detailed in the security functional requirement “*Management of security attributes (FMT_MSA.1) / Loader*”. The security functional requirements “*Security roles (FMT_SMR.1) / Loader*” and “*Timing of identification (FIA_UID.1) / Loader*” specifies the roles that the TSF recognises and the actions authorised before their identification. The security functional requirement “*Specification of management functions (FMT_SMF.1) / Loader*” provides additional controlled facility for adapting the loader behaviour to the user’s needs. These management

functions ensure that the required access control, associated to the loading feature, can be realised using the functions provided by the TOE.

Security objective “Access control for MFPlus (*O.Access-Control-MFPlus*)”

- 413 The justification related to the security objective “Access control for MFPlus (*O.Access-Control-MFPlus*)” is as follows:
- 414 The security functional requirement "*Security roles (FMT_SMR.1) / MFPlus*" defines the roles of the MFPlus Access Control Policy.
 The security functional requirements "*Subset access control (FDP_ACC.1) / MFPlus*" and "*Security attribute based access control (FDP_ACF.1) / MFPlus*" define the rules and "*Static attribute initialisation (FMT_MSA.3) / MFPlus*" and "*Management of security attributes (FMT_MSA.1) / MFPlus*" the attributes that the access control is based on.
 The security functional requirement "*Management of TSF data (FMT_MTD.1) / MFPlus*" provides the rules for the management of the authentication data.
 The management functions are defined by "*Specification of Management Functions (FMT_SMF.1) / MFPlus*".
 Since the TOE stores data on behalf of the authorised subjects, import of user data with security attributes is defined by "*Import of user data with security attributes (FDP_ITC.2) / MFPlus*".
 Since cryptographic keys are used for authentication (refer to *O.Authentication-MFPlus*), these keys have to be removed if they are no longer needed for the access control. This is required by "*Cryptographic key destruction (FCS_CKM.4) / MFPlus*".
 These nine SFRs together provide an access control mechanism as required by the objective *O.Access-Control-MFPlus*.

Security objective “Authentication for MFPlus (*O.Authentication-MFPlus*)”

- 415 The justification related to the security objective “Authentication for MFPlus (*O.Authentication-MFPlus*)” is as follows:
- 416 The security functional requirement "*Cryptographic operation (FCS_COP.1) / AES*" requires that the TOE provides the basic cryptographic algorithm that can be used to perform the authentication.
 The security functional requirements "*User identification before any action (FIA_UID.2) / MFPlus*", "*User authentication before any action (FIA_UAU.2) / MFPlus*" and "*Multiple authentication mechanisms (FIA_UAU.5) / MFPlus*" together define that users must be identified and authenticated before any action.
 "*Trusted path (FTP_TRP.1) / MFPlus*" requires a trusted communication path between the TOE and remote users; FTP_TRP.1.3 especially requires “authentication requests”.
 Together with "*Replay detection (FPT_RPL.1) / MFPlus*" which requires a replay detection for these authentication requests, the six security functional requirements fulfill the objective *O.Authentication-MFPlus*.

Security objective “Confidential Communication (*O.Encryption*)”

- 417 The justification related to the security objective “Confidential Communication (*O.Encryption*)” is as follows:
- 418 The security functional requirement "*Cryptographic operation (FCS_COP.1) / AES*" requires that the TOE provides the basic cryptographic algorithms that can be used to protect the communication by encryption.
 "*Trusted path (FTP_TRP.1) / MFPlus*" requires a trusted communication path between the TOE and remote users; FTP_TRP.1.3 especially requires a trusted path for “authentication

request, confidentiality and/or data integrity verification for data transfers on request based on a setting in the MFP Configuration Block”.

These two security functional requirements fulfill the objective [O.Encryption](#).

Security objective “MFPlus Integrity-protected Communication ([O.MAC-MFPlus](#))”

419 The justification related to the security objective “MFPlus Integrity-protected Communication ([O.MAC-MFPlus](#))” is as follows:

420 The security functional requirement "[Cryptographic operation \(FCS_COP.1\)](#) / AES" requires that the TOE provides the basic cryptographic algorithms that can be used to compute a MAC which can protect the integrity of the communication.

"[Trusted path \(FTP_TRP.1\)](#) / MFPlus" requires a trusted communication path between the TOE and remote users; FTP_TRP.1.3 especially requires “confidentiality and/or data integrity verification for data transfers on request of the file owner”.

Together with "[Replay detection \(FPT_RPL.1\)](#) / MFPlus" which requires a replay detection for these data transfers, the three security functional requirements fulfill the objective [O.MAC-MFPlus](#).

Security objective “Data type consistency ([O.Type-Consistency-MFPlus](#))”

421 The justification related to the security objective “Data type consistency ([O.Type-Consistency-MFPlus](#))” is as follows:

422 The security functional requirement "[Inter-TSF basic TSF data consistency \(FPT_TDC.1\)](#) / MFPlus" requires the TOE to consistently interpret data blocks. The TOE will honour the respective file formats and boundaries (i.e. upper and lower limits, size limitations).

This meets the objective [O.Type-Consistency-MFPlus](#).

Security objective “Preventing traceability for MFPlus ([O.No-Trace-MFPlus](#))”

423 The justification related to the security objective “Preventing traceability for MFPlus ([O.No-Trace-MFPlus](#))” is as follows:

424 The security functional requirement "[Unlinkability \(FPR_UNL.1\)](#) / MFPlus" requires that unauthorised subjects other than the card holder are unable to determine whether any operation of the TOE were caused by the same user.

This meets the objective [O.No-Trace-MFPlus](#).

Security objective “Treatment of user data for MFPlus ([O.Resp-Appl-MFPlus](#))”

425 The justification related to the security objective “Treatment of user data for MFPlus ([O.Resp-Appl-MFPlus](#))” is as follows:

426 The objective was translated from an environment objective in the PP into a TOE objective in this ST. The objective is that “Security relevant User Data (especially cryptographic keys) are treated by the Security IC Embedded Software as required by the security needs of the specific application context.” The application context is defined by the security environment described in this ST. The additional SFRs defined in this ST do address the additional TOE objectives of the ST based on the ST security environment, therefore [O.Resp-Appl-MFPlus](#) is fulfilled by the additional ST SFRs.

Security objective “NVM resource availability for MFPlus ([O.Resource-MFPlus](#))”

427 The justification related to the security objective “Resource availability for MFPlus ([O.Resource-MFPlus](#))” is as follows:

428 The security functional requirement "[Minimum and maximum quotas \(FRU_RSA.2\) / MFPlus](#)" requires that sufficient parts of the NVM and RAM are reserved for MFPlus use. This fulfils the objective [O.Resource-MFPlus](#).

Security objective “MFPlus code integrity check ([O.Verification-MFPlus](#))”

429 The justification related to the security objective “MFPlus code integrity check ([O.Verification-MFPlus](#))” is as follows:

430 The security functional requirements "[Subset access control \(FDP_ACC.1\) / APPLI_FWL](#)" and "[Security attribute based access control \(FDP_ACF.1\) / APPLI_FWL](#)", supported by "[Static attribute initialisation \(FMT_MSA.3\) / APPLI_FWL](#)", require that MFPlus code integrity is protected. In addition, the security functional requirement "[Failure with preservation of secure state \(FPT_FLS.1\)](#)" requires that in case of error on NVM, MFPlus execution is stopped. This meets the objective [O.Verification-MFPlus](#).

Security objective “MFPlus firewall ([O.Firewall-MFPlus](#))”

431 The justification related to the security objective “MFPlus firewall ([O.Firewall-MFPlus](#))” is as follows:

432 The security functional requirements "[Subset access control \(FDP_ACC.1\) / APPLI_FWL](#)" and "[Security attribute based access control \(FDP_ACF.1\) / APPLI_FWL](#)", supported by "[Static attribute initialisation \(FMT_MSA.3\) / APPLI_FWL](#)", require that no application can read, write, compare any piece of data or code belonging to MFPlus. This meets the objective [O.Firewall-MFPlus](#).

Security objective “MFPlus data cleaning for resource sharing ([O.Shr-Var-MFPlus](#))”

433 The justification related to the security objective “MFPlus data cleaning for resource sharing ([O.Shr-Var-MFPlus](#))” is as follows:

434 The security functional requirement "[Subset residual information protection \(FDP_RIP.1\) / MFPlus](#)" requires that the information content of a resource is made unavailable upon its deallocation from MFPlus. This meets the objective [O.Shr-Var-MFPlus](#).

Security objective “Access control for DESFire ([O.Access-Control-DESFire](#))”

435 The justification related to the security objective “Access control for DESFire ([O.Access-Control-DESFire](#))” is as follows:

436 The security functional requirement "[Security roles \(FMT_SMR.1\) / DESFire](#)" defines the roles of the DESFire Access Control Policy.
The security functional requirements "[Subset access control \(FDP_ACC.1\) / DESFire](#)" and "[Security attribute based access control \(FDP_ACF.1\) / DESFire](#)" define the rules and "[Static attribute initialisation \(FMT_MSA.3\) / DESFire](#)" and "[Management of security attributes \(FMT_MSA.1\) / DESFire](#)" the attributes that the access control is based on.
The security functional requirement "[Management of TSF data \(FMT_MTD.1\) / DESFire](#)" provides the rules for the management of the authentication data.
The management functions are defined by "[Specification of Management Functions](#)"

(*FMT_SMF.1*) / *DESFire*".

Since the TOE stores data on behalf of the authorised subjects, import of user data with security attributes is defined by "*Import of user data with security attributes (FDP_ITC.2)* / *DESFire*".

Since cryptographic keys are used for authentication (refer to *O.Authentication-DESFire*), these keys have to be removed if they are no longer needed for the access control (i.e. an application is deleted). This is required by "*Cryptographic key destruction (FCS_CKM.4)* / *DESFire*". These nine SFRs together provide an access control mechanism as required by the objective *O.Access-Control-DESFire*.

Security objective "Authentication for DESFire (*O.Authentication-DESFire*)"

437 The justification related to the security objective "Authentication for DESFire (*O.Authentication-DESFire*)" is as follows:

438 The two security functional requirements "*Cryptographic operation (FCS_COP.1)* / DES" and "*Cryptographic operation (FCS_COP.1)* / AES" require that the TOE provides the basic cryptographic algorithms that can be used to perform the authentication. The security functional requirements "*User identification before any action (FIA_UID.2)* / *DESFire*", "*User authentication before any action (FIA_UAU.2)* / *DESFire*" and "*Multiple authentication mechanisms (FIA_UAU.5)* / *DESFire*" together define that users must be identified and authenticated before any action. The 'none' authentication of "*Multiple authentication mechanisms (FIA_UAU.5)* / *DESFire*" also ensures that a specific subject is identified and authenticated before an explicit authentication request is sent to the TOE. "*Trusted path (FTP_TRP.1)* / *DESFire*" requires a trusted communication path between the TOE and remote users; FTP_TRP.1.3 especially requires "authentication requests". Together with "*Replay detection (FPT_RPL.1)* / *DESFire*" which requires a replay detection for these authentication requests, the seven security functional requirements fulfil the objective *O.Authentication-DESFire*.

Security objective "DESFire Confidential Communication (*O.Confidentiality-DESFire*)"

439 The justification related to the security objective "DESFire Confidential communication (*O.Confidentiality-DESFire*)" is as follows:

440 The two security functional requirements "*Cryptographic operation (FCS_COP.1)* / DES" and "*Cryptographic operation (FCS_COP.1)* / AES" require that the TOE provides the basic cryptographic algorithm AES that can be used to protect the communication by encryption. "*Trusted path (FTP_TRP.1)* / *DESFire*" requires a trusted communication path between the TOE and remote users; FTP_TRP.1.3 especially requires "confidentiality and/or data integrity verification for data transfers protected with AES and based on a setting in the file attributes". Together with "*Replay detection (FPT_RPL.1)* / *DESFire*" which requires a replay detection for these data transfers, the three security functional requirements fulfil the objective *O.Confidentiality-DESFire*.

Security objective "DESFire Data type consistency (*O.Type-Consistency-DESFire*)"

441 The justification related to the security objective "DESFire Data type consistency (*O.Type-Consistency-DESFire*)" is as follows:

442 The security functional requirement "*Inter-TSF basic TSF data consistency (FPT_TDC.1)* / *DESFire*" requires the TOE to consistently interpret data files and values. The TOE will

honour the respective file formats and boundaries (i.e. upper and lower limits, size limitations). This meets the objective [O.Type-Consistency-DESFire](#).

Security objective “DESFire Transaction mechanism ([O.Transaction-DESFire](#))”

443 The justification related to the security objective “DESFire Transaction mechanism ([O.Transaction-DESFire](#))” is as follows:

444 The security functional requirement "[Basic rollback \(FDP_ROL.1\) / DESFire](#)" requires the possibility to rollback a set of modifying operations on backup files in total. The set of operations is defined by the scope of the transaction, which is itself limited by some boundary events. This fulfils the objective [O.Transaction-DESFire](#).

Security objective “Preventing traceability for DESFire ([O.No-Trace-DESFire](#))”

445 The justification related to the security objective “Preventing traceability for DESFire ([O.No-Trace-DESFire](#))” is as follows:

446 The security functional requirement "[Unlinkability \(FPR_UNL.1\) / DESFire](#)" requires that unauthorised subjects other than the card holder are unable to determine whether any operation of the TOE were caused by the same user. This meets the objective [O.No-Trace-DESFire](#).

Security objective “Treatment of user data for DESFire ([O.Resp-Appl-DESFire](#))”

447 The justification related to the security objective “Treatment of user data for DESFire ([O.Resp-Appl-DESFire](#))” is as follows:

448 The objective was translated from an environment objective in the PP into a TOE objective in this ST. The objective is that “Security relevant User Data (especially cryptographic keys) are treated by the Security IC Embedded Software as required by the security needs of the specific application context.” The application context is defined by the security environment described in this ST. The additional SFRs defined in this ST do address the additional TOE objectives of the ST based on the ST security environment, therefore [O.Resp-Appl-DESFire](#) is fulfilled by the additional ST SFRs.

Security objective “NVM resource availability for DESFire ([O.Resource-DESFire](#))”

449 The justification related to the security objective “Resource availability for DESFire ([O.Resource-DESFire](#))” is as follows:

450 The security functional requirement "[Minimum and maximum quotas \(FRU_RSA.2\) / DESFire](#)" requires that sufficient parts of the NVM and RAM are reserved for DESFire use. This fulfils the objective [O.Resource-DESFire](#).

Security objective “DESFire code integrity check ([O.Verification-DESFire](#))”

451 The justification related to the security objective “DESFire code integrity check ([O.Verification-DESFire](#))” is as follows:

452 The security functional requirements "[Subset access control \(FDP_ACC.1\) / APPLI_FWL](#)" and "[Security attribute based access control \(FDP_ACF.1\) / APPLI_FWL](#)", supported by "[Static attribute initialisation \(FMT_MSA.3\) / APPLI_FWL](#)", require that MFPlus code integrity is protected. In addition, the security functional requirement "[Failure with preservation of secure state \(FPT_FLS.1\)](#)" requires that in case of error on NVM, MFPlus execution is stopped. This meets the objective [O.Verification-DESFire](#).

Security objective “DESFire firewall ([O.Firewall-DESFire](#))”

453 The justification related to the security objective “DESFire firewall ([O.Firewall-DESFire](#))” is as follows:

454 The security functional requirements "[Subset access control \(FDP_ACC.1\) / APPLI_FWL](#)" and "[Security attribute based access control \(FDP_ACF.1\) / APPLI_FWL](#)", supported by "[Static attribute initialisation \(FMT_MSA.3\) / APPLI_FWL](#)", require that no application can read, write, compare any piece of data or code belonging to DESFire. This meets the objective [O.Firewall-DESFire](#).

Security objective “DESFire data cleaning for resource sharing ([O.Shr-Res-DESFire](#))”

455 The justification related to the security objective “DESFire data cleaning for resource sharing ([O.Shr-Res-DESFire](#))” is as follows:

456 The security functional requirement "[Subset residual information protection \(FDP_RIP.1\) / DESFire](#)" requires that the information content of a resource is made unavailable upon its deallocation from DESFire. This meets the objective [O.Shr-Res-DESFire](#).

5.4.3 Additional security requirements are consistent**"Cryptographic operation ([FCS_COP.1](#)) & key generation ([FCS_CKM.1](#))"**

457 These security requirements have already been argued in [Section : Security objective “Additional Specific Security Functionality \(AUG1.O.Add-Functions\)”](#) above.

**"Static attribute initialisation ([FMT_MSA.3 / Memories](#)),
Management of security attributes ([FMT_MSA.1 / Memories](#)),
Complete access control ([FDP_ACC.2 / Memories](#)),
Security attribute based access control ([FDP_ACF.1 / Memories](#))"**

458 These security requirements have already been argued in [Section : Security objective “Dynamic Area based Memory Access Control \(AUG4.O.Mem-Access\)”](#) above.

**"Import of user data without security attribute ([FDP_ITC.1 / Loader](#)),
Static attribute initialisation ([FMT_MSA.3 / Loader](#)),
Management of security attributes ([FMT_MSA.1 / Loader](#)),
Subset access control ([FDP_ACC.1 / Loader](#)),
Security attribute based access control ([FDP_ACF.1 / Loader](#)),
Specification of management function ([FMT_SMF.1 / Loader](#)),
Security roles ([FMT_SMR.1 / Loader](#)),
Timing of identification([FIA_UID.1 / Loader](#))"**

459 These security requirements have already been argued in [Section : Security objective “Controlled loading of the Security IC Embedded Software \(O.Controlled-ES-Loading\)”](#) above.

"Security roles ([FMT_SMR.1 / MFPlus](#)),
 Subset access control ([FDP_ACC.1 / MFPlus](#)),
 Security attribute based access control ([FDP_ACF.1 / MFPlus](#)),
 Static attribute initialisation ([FMT_MSA.3 / MFPlus](#)),
 Management of security attributes ([FMT_MSA.1 / MFPlus](#)),
 Specification of TSF data ([FMT_MTD.1 / MFPlus](#))
 Specification of management function ([FMT_SMF.1 / MFPlus](#))
 Import of user data with security attributes ([FDP_ITC.2 / MFPlus](#))
 Cryptographic key destruction ([FCS_CKM.4 / MFPlus](#))"

460 These security requirements have already been argued in [Section : Security objective "Access control for MFPlus \(O.Access-Control-MFPlus\)"](#), above.

"User identification before any action ([FIA_UID.2 / MFPlus](#)),
 User authentication before any action ([FIA_UAU.2 / MFPlus](#)),
 Multiple authentication mechanisms ([FIA_UAU.5 / MFPlus](#))"

461 These security requirements have already been argued in [Section : Security objective "Authentication for MFPlus \(O.Authentication-MFPlus\)"](#) and [Section : Security objective "Confidential Communication \(O.Encryption\)"](#) above.

"Trusted path ([FPT_TRP.1 / MFPlus](#)),
 Replay detection ([FPT_RPL.1 / MFPlus](#))"

462 These security requirements have already been argued in [Section : Security objective "MFPlus Integrity-protected Communication \(O.MAC-MFPlus\)"](#) above.

Inter-TSF basic TSF data consistency ([FPT_TDC.1 / MFPlus](#))

463 This security requirement has already been argued in [Section : Security objective "Data type consistency \(O.Type-Consistency-MFPlus\)"](#) above.

"Unlinkability ([FPR_UNL.1 / MFPlus](#))"

464 This security requirement has already been argued in [Section : Security objective "Preventing traceability for MFPlus \(O.No-Trace-MFPlus\)"](#) above.

"Minimum and maximum quotas ([FRU_RSA.2 / MFPlus](#))"

465 This security requirement has already been argued in [Section : Security objective "NVM resource availability for MFPlus \(O.Resource-MFPlus\)"](#) above.

"Subset residual information protection ([FDP_RIP.1 / MFPlus](#))"

466 This security requirement has already been argued in [Section : Security objective "MFPlus data cleaning for resource sharing \(O.Shr-Var-MFPlus\)"](#) above.

"Security roles ([FMT_SMR.1 / DESFire](#)),
Subset access control ([FDP_ACC.1 / DESFire](#)),
Security attribute based access control ([FDP_ACF.1 / DESFire](#)),
Static attribute initialisation ([FMT_MSA.3 / DESFire](#)),
Management of security attributes ([FMT_MSA.1 / DESFire](#)),
Specification of TSF data ([FMT_MTD.1 / DESFire](#))
Specification of management function ([FMT_SMF.1 / DESFire](#))
Import of user data with security attributes ([FDP_ITC.2 / DESFire](#))
Cryptographic key destruction ([FCS_CKM.4 / DESFire](#))"

467 These security requirements have already been argued in [Section : Security objective "Access control for DESFire \(O.Access-Control-DESFire\)"](#) above.

"User identification before any action ([FIA_UID.2 / DESFire](#)),
User authentication before any action ([FIA_UAU.2 / DESFire](#)),
Multiple authentication mechanisms ([FIA_UAU.5 / DESFire](#))"

468 These security requirements have already been argued in [Section : Security objective "Authentication for DESFire \(O.Authentication-DESFire\)"](#) above.

"Trusted path ([FPT_TRP.1 / DESFire](#)),
Replay detection ([FPT_RPL.1 / DESFire](#))"

469 These security requirements have already been argued in [Section : Security objective "DESFire Confidential Communication \(O.Confidentiality-DESFire\)"](#) above.

"Inter-TSF basic TSF data consistency ([FPT_TDC.1 / DESFire](#))"

470 This security requirement has already been argued in [Section : Security objective "DESFire Data type consistency \(O.Type-Consistency-DESFire\)"](#) above.

"Basic rollback ([FDP_ROL.1 / DESFire](#))"

471 This security requirement has already been argued in [Section : Security objective "DESFire Transaction mechanism \(O.Transaction-DESFire\)"](#) above.

"Unlinkability ([FPR_UNL.1 / DESFire](#))"

472 This security requirement has already been argued in [Section : Security objective "Preventing traceability for DESFire \(O.No-Trace-DESFire\)"](#) above.

"Minimum and maximum quotas ([FRU_RSA.2 / DESFire](#))"

473 This security requirement has already been argued in [Section : Security objective "NVM resource availability for DESFire \(O.Resource-DESFire\)"](#) above.

"Subset access control ([FDP_ACC.1 / APPLI_FWL](#)),
Security attribute based access control ([FDP_ACF.1 / APPLI_FWL](#)),
Static attribute initialisation ([FMT_MSA.3 / APPLI_FWL](#)),

474 These security requirements have already been argued in [Section : Security objective "Access control for MFPlus \(O.Access-Control-MFPlus\)"](#), [Section : Security objective "MFPlus firewall \(O.Firewall-MFPlus\)"](#), and [Section : Security objective "DESFire firewall \(O.Firewall-DESFire\)"](#) above.

"Subset residual information protection ([FDP_RIP.1 / DESFire](#))"

475 This security requirement has already been argued in [Section : Security objective "DESFire data cleaning for resource sharing \(O.Shr-Res-DESFire\)"](#) above.

5.4.4 Dependencies of Security Functional Requirements

476 All dependencies of Security Functional Requirements have been fulfilled in this Security Target except :

- those justified in the [BSI-CC-PP-0084-2014](#) protection profile security requirements rationale,
- those justified in [AUG](#) security requirements rationale,
- the dependency of [FCS_COP.1](#) and [FCS_CKM.1](#) on FCS_CKM.4 (see discussion below).
- the dependency of [FMT_MSA.3 / APPLI_FWL](#) on FMT_MSA.1 and FMT_SMR.1 (see discussion below).

477 Details are provided in [Table 13](#) below.

Table 13. Dependencies of security functional requirements

Label	Dependencies	Fulfilled by security requirements in this Security Target	Dependency already in BSI-CC-PP-0084-2014 or in AUG
FRU_FLT.2	FPT_FLS.1	Yes	Yes, BSI-CC-PP-0084-2014
FPT_FLS.1	None	No dependency	Yes, BSI-CC-PP-0084-2014
FMT_LIM.1 / Test	FMT_LIM.2 / Test	Yes	Yes, BSI-CC-PP-0084-2014
FMT_LIM.2 / Test	FMT_LIM.1 / Test	Yes	Yes, BSI-CC-PP-0084-2014
FMT_LIM.1 / Loader	FMT_LIM.2 / Loader	Yes	Yes, BSI-CC-PP-0084-2014
FMT_LIM.2 / Loader	FMT_LIM.1 / Loader	Yes	Yes, BSI-CC-PP-0084-2014
FAU_SAS.1	None	No dependency	Yes, BSI-CC-PP-0084-2014
FDP_SDC.1	None	No dependency	Yes, BSI-CC-PP-0084-2014
FDP_SDI.2	None	No dependency	Yes, BSI-CC-PP-0084-2014
FPT_PHP.3	None	No dependency	Yes, BSI-CC-PP-0084-2014
FDP_ITT.1	FDP_ACC.1 or FDP_IFC.1	Yes	Yes, BSI-CC-PP-0084-2014
FPT_ITT.1	None	No dependency	Yes, BSI-CC-PP-0084-2014
FDP_IFC.1	FDP_IFF.1	No, see BSI-CC-PP-0084-2014	Yes, BSI-CC-PP-0084-2014
FCS_RNG.1	None	No dependency	Yes, BSI-CC-PP-0084-2014

Table 13. Dependencies of security functional requirements (continued)

Label	Dependencies	Fulfilled by security requirements in this Security Target	Dependency already in BSI-CC-PP-0084-2014 or in AUG
FCS_COP.1	[FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1]	Yes, by FDP_ITC.1 and FCS_CKM.1, see discussion below	Yes, AUG #1
	FCS_CKM.4	No, see discussion below	
FCS_CKM.1	[FDP_CKM.2 or FCS_COP.1]	Yes, by FCS_COP.1	
	FCS_CKM.4	No, see discussion below	
FDP_ACC.2 / Memories	FDP_ACF.1 / Memories	Yes	No , CCMB-2012-09-002 R4
FDP_ACF.1 / Memories	FDP_ACC.1 / Memories	Yes, by FDP_ACC.2 / Memories	Yes, AUG #4
	FMT_MSA.3 / Memories	Yes	
FMT_MSA.3 / Memories	FMT_MSA.1 / Memories	Yes	Yes, AUG #4
	FMT_SMR.1 / Memories	No, see AUG #4	
FMT_MSA.1 / Memories	[FDP_ACC.1 / Memories or FDP_IFC.1]	Yes, by FDP_ACC.2 / Memories and FDP_IFC.1	Yes, AUG #4
	FMT_SMF.1 / Memories	Yes	No , CCMB-2012-09-002 R4
	FMT_SMR.1 / Memories	No, see AUG #4	Yes, AUG #4
FMT_SMF.1 / Memories	None	No dependency	No , CCMB-2012-09-002 R4
FMT_ITC.1 / Loader	[FDP_ACC.1 / Loader or FDP_IFC.1]	Yes	No , CCMB-2012-09-002 R4

FDP_RIP.1 / DESFire	None	No dependency	No , <i>CCMB-2012-09-002 R4</i>

478 Part 2 of the Common Criteria defines the dependency of "*Cryptographic operation (FCS_COP.1)*" on "Import of user data without security attributes (FDP_ITC.1)" or "Import of user data with security attributes (FDP_ITC.2)" or "Cryptographic key generation (FCS_CKM.1)". In this particular TOE, both "*Cryptographic key generation (FCS_CKM.1)*" and "*Import of user data without security attributes (FDP_ITC.1) / Loader*" may be used for the purpose of creating cryptographic keys, but also, the ES has all possibilities to implement its own creation function, in conformance with its security policy.

479 Part 2 of the Common Criteria defines the dependency of "*Cryptographic operation (FCS_COP.1)*" and "*Cryptographic key generation (FCS_CKM.1)*" on "Cryptographic key destruction (FCS_CKM.4)". In this particular TOE, there is no specific function for the destruction of the keys. The ES has all possibilities to implement its own destruction function, in conformance with its security policy. Therefore, FCS_CKM.4 is not defined in this ST.

480 Part 2 of the Common Criteria defines the dependency of "[Static attribute initialisation \(FMT_MSA.3\) / APPLI_FWL](#)" on "Management of security attributes (FMT_MSA.1)" and "Security roles (FMT_SMR.1)". For this particular instantiation of the access control attributes aimed at protecting DESFire and MFPlus code and data from unauthorised accesses, the security attributes are only static, initialized at product start. Therefore, there is no need to identify management capabilities and associated roles in form of Security Functional Requirements "FMT_MSA.1" and "FMT_SMR.1".

5.4.5 Rationale for the Assurance Requirements

Security assurance requirements added to reach EAL5 ([Table 10](#))

481 Regarding application note 21 of [BSI-CC-PP-0084-2014](#), this Security Target chooses EAL5 with augmentations because developers and users require a high level of independently assured security in a planned development and require a rigorous development approach without incurring unreasonable costs attributable to specialist security engineering techniques.

482 EAL5 represents a meaningful increase in assurance from EAL4 by requiring semiformal design descriptions, a more structured (and hence analyzable) architecture, and improved mechanisms and/or procedures that provide confidence that the TOE will not be tampered during development.

483 The assurance components in an evaluation assurance level (EAL) are chosen in a way that they build a mutually supportive and complete set of components. All dependencies introduced by the requirements chosen for augmentation are fulfilled. Therefore, these components add additional assurance to EAL5, but the mutual support of the requirements and the internal consistency is still guaranteed.

484 Note that detailed and updated refinements for assurance requirements are given in [Section 5.3](#).

Dependencies of assurance requirements

485 Dependencies of security assurance requirements are fulfilled by the EAL5 package selection.

486 The augmentation to this package identified in paragraph [380](#) do not introduce dependencies not already satisfied by the EAL5 package, and is considered as consistent augmentation:

- ALC_FLR.1 has no dependency.
- ASE_TSS.2 dependencies (ASE_INT.1, ASE_REQ.1 and ADV_ARC.1) are fulfilled by the assurance requirements claimed by this ST.

6 TOE summary specification (ASE_TSS)

487 This section demonstrates how the TOE meets each Security Functional Requirement,
488 which will be further detailed in the ADV_FSP documents.

488 The complete TOE summary specification has been presented and evaluated in the
*ST31G480 C02 including optional cryptographic library Neslib, and optional technologies
MIFARE® DESFire® EV1 and MIFARE Plus® X Security Target.*

489 For confidentiality reasons, the TOE summary specification is not fully reproduced here.

6.1 Limited fault tolerance (FRU_FLT.2)

490 The TSF provides limited fault tolerance, by managing a certain number of faults or errors
that may happen, related to random number generation, power supply, data flows and
cryptographic operations, thus preventing risk of malfunction.

6.2 Failure with preservation of secure state (FPT_FLS.1)

491 The TSF provides preservation of secure state by detecting and managing the following
events, resulting in an immediate interruption or reset:

- Die integrity violation detection,
- Errors on memories,
- Glitches,
- High voltage supply,
- CPU errors,
- MPU errors,
- External clock incorrect frequency,
- Sequence control,
- etc..

492 The ES can generate a software reset.

6.3 Limited capabilities (FMT_LIM.1) / Test

493 The TSF ensures that only very limited test capabilities are available in User configuration,
in accordance with SFP_1: Limited capability and availability Policy / Test.

6.4 Limited capabilities (FMT_LIM.1) / Loader

494 The TSF ensures that the Secure Flash Loader and the final test capabilities are unavailable
in User configuration, in accordance with SFP_4: Loader Limited capability Policy.

6.5 Limited availability (FMT_LIM.2) / Test & (FMT_LIM.2) / Loader

- 495 The TOE is either in Test, Admin (aka Issuer) or User configuration.
- 496 The only authorised TOE configuration modifications are:
- Test to Admin configuration,
 - Test to User configuration,
 - Admin to User configuration.
- 497 The TSF ensures the switching and the control of TOE configuration.
- 498 The TSF reduces the available features depending on the TOE configuration.

6.6 Stored data confidentiality (FDP_SDC.1)

- 499 The TSF ensures confidentiality of the User Data in all the memories where it can be stored.

6.7 Stored data integrity monitoring and action (FDP_SDI.2)

- 500 The TSF ensures confidentiality of the User Data in all the memories where it can be stored.

6.8 Audit storage (FAU_SAS.1)

- 501 In User configuration, the TOE provides commands to store data and/or pre-personalisation data and/or supplements of the ES in the NVM. These commands are only available to authorized processes, and only until phase 6.

6.9 Resistance to physical attack (FPT_PHP.3)

- 502 The TSF ensures resistance to physical tampering, thanks to the following features:
- The TOE implements a set of countermeasures that reduce the exploitability of physical probing.
 - The TOE is physically protected by active shields that command an automatic reaction on die integrity violation detection.

6.10 Basic internal transfer protection (FDP_ITT.1), Basic internal TSF data transfer protection (FPT_ITT.1) & Subset information flow control (FDP_IFC.1)

- 503 The TSF prevents the disclosure of internal and user data thanks to:
- Memories scrambling and encryption,
 - Bus encryption,
 - Mechanisms for operation execution concealment,
 - etc..

6.11 Random number generation (FCS_RNG.1)

504 The TSF provides 8-bit true random numbers that can be qualified with the test metrics required by the [BSI-AIS20/AIS31](#) standard for a PTG.2 class device.

6.12 Cryptographic operation: TDES operation (FCS_COP.1) / TDES

505 The TOE provides an EDES+ accelerator that has the capability to perform Triple DES^(c) encryption and decryption conformant to [NIST SP 800-67](#).
The EDES+ accelerator offers a Cipher Block Chaining (CBC) mode conformant to [NIST SP 800-38A](#).

506 If [NesLib](#) is embedded, the cryptographic library NesLib instantiates the same standard DES cryptographic operations.

507 The DESFire library uses Triple DES as cryptographic operation (EDES+ accelerator). Cryptographic operations are used for setting up the mutual authentication, for encryption and message authentication.

6.13 Cryptographic operation: AES operation (FCS_COP.1) / AES

508 The AES accelerator provides the following standard AES cryptographic operations for key sizes of 128, 192 and 256 bits, conformant to [FIPS PUB 197](#) with intrinsic counter-measures against attacks:

- randomize,
- key expansion,
- cipher,
- inverse cipher.

509 If NesLib is embedded, the cryptographic library NesLib instantiates the same standard AES cryptographic operations, and provides:

- message authentication Code computation (CMAC).

510 The DESFire and MFPlus libraries use AES as cryptographic operation (AES accelerator). Cryptographic operations are used for setting up the mutual authentication, for encryption and message authentication.

6.14 Cryptographic operation: RSA operation (FCS_COP.1) / RSA if [NesLib](#) only

511 The cryptographic library NesLib provides the RSA public key cryptographic operation for modulus sizes up to 4096 bits, conformant to [PKCS #1 V2.1](#).

512 The cryptographic library NesLib provides the RSA private key cryptographic operation with or without CRT for modulus sizes up to 4096 bits, conformant to [PKCS #1 V2.1](#).

c. Note that triple DES with two keys is no longer recommended as encryption function in the context of smart card applications. Hence, Security IC Embedded Software may need to use triple DES with three keys to achieve a suitable strength.

513 The cryptographic library NesLib provides RSA signature formatting (EMSA) compliant with [PKCS #1 V2.1](#).

6.15 Cryptographic operation: Elliptic Curves Cryptography operation (FCS_COP.1) / ECC if NesLib only

514 The cryptographic library NesLib provides to the ES developer the following efficient basic functions for Elliptic Curves Cryptography over prime fields, all conformant to [IEEE 1363-2000](#) and [IEEE 1363a-2004](#), including:

- private scalar multiplication,
- preparation of Elliptic Curve computations in affine coordinates,
- public scalar multiplication,
- point validity check,
- Jacobian conversion to affine coordinates,
- general point addition,
- point expansion and compression.

515 Additionally, the cryptographic library NesLib provides functions dedicated to the two most used elliptic curves cryptosystems: Elliptic Curve Diffie-Hellman (ECDH), as specified in [NIST SP 800-56A](#) and Elliptic Curve Digital Signature Algorithm (ECDSA) generation and verification, as stipulated in [FIPS PUB 186-4](#) and specified in [ANSI X9.62](#), section 7.

6.16 Cryptographic operation: SHA operation (FCS_COP.1) / SHA, if NesLib only

516 The cryptographic library NesLib provides the SHA-1^(d), SHA-224, SHA-256, SHA-384, SHA-512 secure hash functions conformant to [FIPS PUB 180-2](#).

517 The cryptographic library NesLib provides the SHA-1^(d) and SHA-256 secure hash functions conformant to [FIPS PUB 180-2](#), and offering resistance against side channel and fault attacks.

518 Additionally, the cryptographic library NesLib offers support for the HMAC mode of use, as specified in [FIPS PUB 198-1](#), to be used in conjunction with the protected versions of SHA-1^(d) and SHA-256.

6.17 Cryptographic operation: DRBG operation (FCS_COP.1) / DRBG, if NesLib only

519 The cryptographic library NesLib gives support for a DRBG generator, based on cryptographic algorithms specified in [NIST SP 800-90](#).

520 The cryptographic library NesLib implements two of the DRBG specified in [NIST SP 800-90](#):

- Hash-DRBG,
- CTR-DRBG.

d. Note that SHA-1 is no longer recommended as a cryptographic function. Hence, Security IC Embedded Software may need to use another SHA to achieve a suitable strength.

6.18 Cryptographic operation: Keccak operation (FCS_COP.1) / Keccak, if NesLib 5.2 only

- 521 The cryptographic library NesLib provides the operation of the following extendable output functions conformant to [FIPS PUB 202](#):
- SHAKE128,
 - SHAKE256,
 - Keccak[r,c] with choice of $r < 1600$ and $c = 1600 - r$.
- 522 The cryptographic library NesLib provides the operation of the following hash functions, conformant to [FIPS PUB 202](#):
- SHA3-224,
 - SHA3-256,
 - SHA3-384,
 - SHA3-512.
- 523 The cryptographic library NesLib provides the operation of the following extendable output functions conformant to [FIPS PUB 202](#), offering resistance against side channel and fault attacks:
- SHAKE128,
 - SHAKE256,
 - Keccak[r,c] with choice of $r < 1600$ and $c = 1600 - r$.
- 524 The cryptographic library NesLib provides the operation of the following hash functions, conformant to [FIPS PUB 202](#), offering resistance against side channel and fault attacks:
- SHA3-224,
 - SHA3-256,
 - SHA3-384,
 - SHA3-512.

6.19 Cryptographic operation: Keccak-p operation (FCS_COP.1) / Keccak-p, if NesLib 5.2 only

- 525 The cryptographic library NesLib provides a toolbox for building modes on top of the following permutations, conformant to [FIPS PUB 202](#):
- Keccak-p[1600,n_r = 24],
 - Keccak-p[1600,n_r = 12].
 - The cryptographic library NesLib provides a toolbox for building modes on top of the following permutations, conformant to [FIPS PUB 202](#), offering resistance against side channel and fault attacks:
 - Keccak-p[1600,n_r = 24],
 - Keccak-p[1600,n_r = 12].

6.20 Cryptographic operation: Diffie-Hellman operation (FCS_COP.1) / Diffie-Hellman, if NesLib 5.2 only

526 The cryptographic library NesLib provides the Diffie-Hellman key establishment operation over GF(p) for size of modulus p up to 4096 bits, conformant to [ANSI X9.42](#).

6.21 Cryptographic key generation: Prime generation (FCS_CKM.1) / Prime_generation, if NesLib only

527 The cryptographic library NesLib provides prime numbers generation for prime sizes up to 2048 bits conformant to [FIPS PUB 140-2](#) and [FIPS PUB 186-4](#), optionally with conditions and/or optionally offering resistance against side channel and fault attacks.

6.22 Cryptographic key generation: RSA key generation (FCS_CKM.1) / RSA_key_generation, if NesLib only

528 The cryptographic library NesLib provides standard RSA public and private key computation for key sizes upto 4096 bits conformant to [FIPS PUB 140-2](#), [ISO/IEC 9796-2](#) and [PKCS #1 V2.1](#), optionally with conditions and/or optionally offering resistance against side channel and fault attacks.

6.23 Static attribute initialisation (FMT_MSA.3) / Memories

529 The TOE enforces a default memory protection policy when none other is programmed by the ES.

6.24 Management of security attributes (FMT_MSA.1) / Memories & Specification of management functions (FMT_SMF.1) / Memories

530 The TOE provides a dynamic Memory Protection Unit (MPU), that can be configured by the ES.

6.25 Complete access control (FDP_ACC.2) / Memories & Security attribute based access control (FDP_ACF.1) / Memories

531 The TOE enforces the dynamic memory protection policy for data access and code access thanks to a dynamic Memory Protection Unit (MPU), programmed by the ES. Overriding the MPU set of access rights, the TOE enforces additional protections on specific parts of the memories.

6.26 Static attribute initialisation (FMT_MSA.3) / Loader

532 In Admin configuration, the System Firmware provides restrictive default values for the Flash Loader security attributes.

6.27 Management of security attributes (FMT_MSA.1) / Loader & Specification of management functions (FMT_SMF.1) / Loader

533 In Admin configuration, the System Firmware provides the capability to change part of the Flash Loader security attributes, only once in the product lifecycle.

6.28 Subset access control (FDP_ACC.1) / Loader, Security attribute based access control (FDP_ACF.1) / Loader, Security roles (FMT_SMR.1) / Loader & Timing of identification (FIA_UID.1) / Loader

534 In Admin configuration, the System Firmware grants access to the Flash Loader functions, only after presentation of the required valid passwords.

6.29 Import of user data without security attributes (FDP_ITC.1) / Loader

535 In Admin configuration, the System Firmware provides the capability of loading user data into the NVM, while ensuring confidentiality and integrity of the loaded data.

6.30 Security roles (FMT_SMR.1) / MFPlus

536 MFPlus identifies the user to be authenticated by the key block number indicated in the authentication request.

537 In security level 0 when the TOE is in a secure environment, MFPlus identifies and authenticates the role Personaliser by default ; in addition the role Originality Key User can be identified with an explicit authentication request.

538 In the other security levels, MFPlus identifies and authenticates the role Anybody by default and before any authentication request.
The roles Card Administrator, Card Manager, Card Security Level Manager, Card User and Originality Key User are authenticated during the authentication request by the knowledge of the respective cryptographic keys.

6.31 Subset access control (FDP_ACC.1) / MFPlus

539 For each MFPlus command subject to access control, the MFPlus library verifies if the MFPlus access conditions are satisfied and returns an error when this is not the case.

6.32 Security attribute based access control (FDP_ACF.1) / MFPlus

540 The MFPlus library verifies the MFPlus security attributes during the execution of MFPlus commands to enforce the MFPlus Access Control Policy defined by the MFPlus interface specification.

6.33 Static attribute initialisation (FMT_MSA.3) / MFPlus

541 The MFPlus library initialises all the static attributes to the values defined by MFPlus interface specifications before they can be used by the Embedded Software.

6.34 Management of security attributes (FMT_MSA.1) / MFPlus

542 The MFPlus library verifies the MFPlus security attributes during the execution of MFPlus commands to enforce the Access Control Policy on the security attributes.

6.35 Specification of Management Functions (FMT_SMF.1) / MFPlus

543 The MFPlus library implements the management functions defined by the MFPlus interface specifications for authentication, and changing security attributes.

6.36 Import of user data with security attributes (FDP_ITC.2) / MFPlus

544 The MFPlus library implements the MFPlus interface specifications and enforces the Access Control Policy to associate the user data to the security attributes.

6.37 Inter-TSF basic TSF data consistency (FPT_TDC.1) / MFPlus

545 The MFPlus library implements the MFPlus interface specifications, supporting consistent interpretation and modification control of inter-TSF exchanges.

6.38 Cryptographic key destruction (FCS_CKM.4) / MFPlus

546 The MFPlus library erases key values from memory after their context becomes obsolete.

6.39 User identification before any action (FIA_UID.2) / MFPlus

547 The MFPlus library identifies the user through the key selected for authentication as specified by the MFPlus Interface Specification.

6.40 User authentication before any action (FIA_UAU.2) / MFPlus

548 During the authentication, the MFPlus library verifies that the user knows the selected key. This is performed by verifying an encryption, thus preventing to unveil the key.

549 After this authentication, both parties share a session key.

6.41 Multiple authentication mechanisms (FIA_UAU.5) / MFPlus

550 The MFPlus library implements the MFPlus Interface Specification, that has a mechanism to authenticate Card Administrator, Card Manager, Card Security Level Manager, Card User, and Originality Key User, while Everybody is assumed when there is no valid authentication state.

6.42 Management of TSF data (FMT_MTD.1) / MFPlus

551 The MFPlus library implements the MFPlus Interface Specification, restricting key modifications in ways configurable through the security attributes to authenticated users, or disabling key modification capabilities.

6.43 Trusted path (FTP_TRP.1) / MFPlus

552 The MFPlus library implements the MFPlus Interface Specification allowing to establish and enforce a trusted path between itself and remote users.

553 The mechanisms include encryption of keys and CMAC on commands and responses.

6.44 Replay detection (FPT_RPL.1) / MFPlus

554 The MFPlus library implements the MFPlus authentication command, and authenticated commands, that allow replay detection.

6.45 Unlinkability (FPR_UNL.1) / MFPlus

555 MFPlus provides an Administrator option to use random UID during the ISO 14443 anti-collision sequence, preventing the traceability through UID. At higher level, the MFPlus access control - when configured for this purpose - provides traceability protection.

6.46 Minimum and maximum quotas (FRU_RSA.2) / MFPlus

556 The MFPlus library ensures the memory required for its operation is available.

6.47 Subset residual information protection (FDP_RIP.1) / MFPlus

557 At the end of commands execution or upon interrupt, the MFPlus library cleans the confidential data from registers it uses.

6.48 Security roles (FMT_SMR.1) / DESFire

558 DESFire supports the assignment of roles to users through the assignment of different keys for the different roles and through the structure and configuration of the access rights. This allows to distinguish between the roles of Administrator, Application Manager, Application User, and Everybody.

6.49 Subset access control (FDP_ACC.1) / DESFire

559 For each DESFire command subject to access control, the DESFire library verifies if the DESFire access conditions are satisfied and returns an error when this is not the case.

6.50 Security attribute based access control (FDP_ACF.1) / DESFire

560 The DESFire library verifies the DESFire security attributes during the execution of DESFire commands to enforce the Access Control Policy defined by the DESFire interface specification.

6.51 Static attribute initialisation (FMT_MSA.3) / DESFire

561 The DESFire library initialises all the static attributes to the values defined by DESFire interface specifications before they can be used by the Embedded Software.

6.52 Management of security attributes (FMT_MSA.1) / DESFire

562 The DESFire library verifies the DESFire security attributes during the execution of DESFire commands to enforce the Access Control Policy on the security attributes.

6.53 Specification of Management Functions (FMT_SMF.1) / DESFire

563 The DESFire library implements the management functions defined by the DESFire interface specifications for authentication, changing security attributes and creating or deleting an application, a value or a data file.

6.54 Import of user data with security attributes (FDP_ITC.2) / DESFire

564 The DESFire library implements the DESFire interface specifications and enforces the Access Control Policy to associate the user data to the security attributes.

6.55 Inter-TSF basic TSF data consistency (FPT_TDC.1) / DESFire

565 The DESFire library implements the DESFire interface specifications, supporting consistent interpretation and modification control of inter-TSF exchanges.

6.56 Cryptographic key destruction (FCS_CKM.4) / DESFire

566 The DESFire library erases key values from memory after their context becomes obsolete.

6.57 User identification before any action (FIA_UID.2) / DESFire

567 The DESFire library identifies the user through the key selected for authentication as specified by the DESFire Interface Specification.

6.58 User authentication before any action (FIA_UAU.2) / DESFire

568 During the authentication, the DESFire library verifies that the user knows the selected key.

569 After this authentication, both parties share a session key.

6.59 Multiple authentication mechanisms (FIA_UAU.5) / DESFire

570 The DESFire library implements the DESFire Interface Specification, that has a mechanism to authenticate Administrator, Application Manager and Application User, while Everybody is assumed when there is no valid authentication state.

571 Two types of authentication are supported: the native DESFire 3-pass authentication and the ISO authentication.

6.60 Management of TSF data (FMT_MTD.1) / DESFire

572 The DESFire library implements the DESFire Interface Specification, restricting key modifications in ways configurable through the security attributes to authenticated users, or disabling key modification capabilities.

6.61 Trusted path (FTP_TRP.1) / DESFire

573 The DESFire library implements the DESFire Interface Specification allowing to establish and enforce a trusted path between itself and remote users.

6.62 Basic rollback (FDP_ROL.1) / DESFire

574 The DESFire library implements the DESFire transaction mechanism ensuring that either all or none of the (modifying) file commands within a transaction are performed. If not, they are rolled back.

6.63 Replay detection (FPT_RPL.1) / DESFire

575 The DESFire library implements the DESFire authentication command, and authenticated commands, that allow replay detection.

6.64 Unlinkability (FPR_UNL.1) / DESFire

576 DESFire provides an Administrator option to use random UID during the ISO 14443 anti-collision sequence, preventing the traceability through UID. At higher level, the DESFire access control - when configured for this purpose - provides traceability protection.

6.65 Minimum and maximum quotas (FRU_RSA.2) / DESFire

577 The DESFire library ensures the memory required for its operation is available.

6.66 Subset residual information protection (FDP_RIP.1) / DESFire

578 At the end of commands execution or upon interrupt, the DESFire library cleans the confidential data from registers it uses.

**6.67 Subset access control (FDP_ACC.1) / APPLI_FWL & Security
attribute based access control (FDP_ACF.1) / APPLI_FWL**

579 The Library Protection Unit is used to isolate DESFire or MFPlus firmware (code and data) from the rest of the code embedded in the device.

6.68 Static attribute initialisation (FMT_MSA.3) / APPLI_FWL

580 At product start, all the static attributes are initialised, which are needed to protect the segments where the code and data of DESFire or MFPlus are stored.

7 Identification

Table 14. TOE components

IC Maskset name	IC version	Master identification number ⁽¹⁾	Firmware version	OST version	Optional NesLib crypto library version	Optional MIFARE DESFire EV1 version	Optional MIFARE Plus X version
K8L0B	H	00B8h	2.1.0	3.4	4.2.10 or 5.2.0	4.8.12	2.4.6

Appendix A Glossary

A.1 Terms

Authorised user

A user who may, in accordance with the TSP, perform an operation.

Composite product

Security IC product which includes the Security Integrated Circuit (i.e. the TOE) and the Embedded Software and is evaluated as composite target of evaluation.

End-consumer

User of the Composite Product in Phase 7.

Integrated Circuit (IC)

Electronic component(s) designed to perform processing and/or memory functions.

IC Dedicated Software

IC proprietary software embedded in a Security IC (also known as IC firmware) and developed by **ST**. Such software is required for testing purpose (IC Dedicated Test Software) but may provide additional services to facilitate usage of the hardware and/or to provide additional services (IC Dedicated Support Software).

IC Dedicated Test Software

That part of the IC Dedicated Software which is used to test the TOE before TOE Delivery but which does not provide any functionality thereafter.

IC developer

Institution (or its agent) responsible for the IC development.

IC manufacturer

Institution (or its agent) responsible for the IC manufacturing, testing, and pre-personalization.

IC packaging manufacturer

Institution (or its agent) responsible for the IC packaging and testing.

Initialisation data

Initialisation Data defined by the TOE Manufacturer to identify the TOE and to keep track of the Security IC's production and further life-cycle phases are considered as belonging to the TSF data. These data are for instance used for traceability and for TOE identification (identification data)

Object

An entity within the TSC that contains or receives information and upon which subjects perform operations.

Packaged IC

Security IC embedded in a physical package such as micromodules, DIPs, SOICs or TQFPs.

Pre-personalization data

Any data supplied by the Card Manufacturer that is injected into the non-volatile memory by the Integrated Circuits manufacturer (Phase 3). These data are for instance used for traceability and/or to secure shipment between phases.

Secret

Information that must be known only to authorised users and/or the TSF in order to enforce a specific SFP.

Security IC

Composition of the TOE, the Security IC Embedded Software, User Data, and the package.

Security IC Embedded SoftWare (ES)

Software embedded in the Security IC and not developed by the IC designer. The Security IC Embedded Software is designed in Phase 1 and embedded into the Security IC in Phase 3.

Security IC embedded software (ES) developer

Institution (or its agent) responsible for the security IC embedded software development and the specification of IC pre-personalization requirements, if any.

Security attribute

Information associated with subjects, users and/or objects that is used for the enforcement of the TSP.

Sensitive information

Any information identified as a security relevant element of the TOE such as:

- the application data of the TOE (such as IC pre-personalization requirements, IC and system specific data),
- the security IC embedded software,
- the IC dedicated software,
- the IC specification, design, development tools and technology.

Smartcard

A card according to ISO 7816 requirements which has a non volatile memory and a processing unit embedded within it.

Subject

An entity within the TSC that causes operations to be performed.

Test features

All features and functions (implemented by the IC Dedicated Software and/or hardware) which are designed to be used before TOE Delivery only and delivered as part of the TOE.

TOE Delivery

The period when the TOE is delivered which is after Phase 3 *or Phase 4 in this Security target*.

TSF data

Data created by and for the TOE, that might affect the operation of the TOE.

User

Any entity (human user or external IT entity) outside the TOE that interacts with the TOE.

User data

All data managed by the Smartcard Embedded Software in the application context. User data comprise all data in the final Smartcard IC except the TSF data.

A.2 Abbreviations

Table 21. List of abbreviations

Term	Meaning
AIS	Application notes and Interpretation of the Scheme (BSI).
BE	Back End manufacturing.
BSI	Bundesamt für Sicherheit in der Informationstechnik.
CBC	Cipher Block Chaining.
CC	Common Criteria Version 3.1. R4.
CPU	Central Processing Unit.
CRC	Cyclic Redundancy Check.
DCSSI	Direction Centrale de la Sécurité des Systèmes d'Information.
DES	Data Encryption Standard.
DESFire	MIFARE® DESFire® EV1.
DEV	Development.
DIP	Dual-In-Line Package.
DRBG	Deterministic Random Bit Generator.
EAL	Evaluation Assurance Level.
ECB	Electronic Code Book.
EDES	Enhanced DES.
EEPROM	Electrically Erasable Programmable Read Only Memory.
ES	Security IC Embedded Software.
EWS	Electrical Wafer Sort.
FE	Front End manufacturing.
FIPS	Federal Information Processing Standard.
I/O	Input / Output.
IC	Integrated Circuit.
ISO	International Standards Organisation.
IT	Information Technology.
LPU	Library Protection Unit.
MASK	Mask manufacturing.
MPU	Memory Protection Unit.
MFPlus	MIFARE Plus® X.
NESCRYPT	Next Step Cryptography Accelerator.
NIST	National Institute of Standards and Technology.

Table 21. List of abbreviations (continued)

Term	Meaning
NVM	Non Volatile Memory.
OSP	Organisational Security Policy.
OST	Operating System for Test.
PP	Protection Profile.
PUB	Publication Series.
RAM	Random Access Memory.
RF	Radio Frequency.
RF UART	Radio Frequency Universal Asynchronous Receiver Transmitter.
ROM	Read Only Memory.
RSA	Rivest, Shamir & Adleman.
SAR	Security Assurance Requirement.
SFP	Security Function Policy.
SFR	Security Functional Requirement.
SOIC	Small Outline IC.
ST	Context dependent : STMicroelectronics or Security Target.
TOE	Target of Evaluation.
TQFP	Thin Quad Flat Package.
TRNG	True Random Number Generator.
TSC	TSF Scope of Control.
TSF	TOE Security Functionality.
TSFI	TSF Interface.
TSP	TOE Security Policy.
TSS	TOE Summary Specification.
WHS	Warehouse.

9 Revision history

Table 22. Document revision history

Date	Revision	Changes	
23-Jun-2017	C01.1	Creation	
23-Feb-2018	C02.1	Change in guidances versions, capacitor possible values	
12-Apr-2018	C02.2	Typo on capacitor value	

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

ST PRODUCTS ARE NOT DESIGNED OR AUTHORIZED FOR USE IN: (A) SAFETY CRITICAL APPLICATIONS SUCH AS LIFE SUPPORTING, ACTIVE IMPLANTED DEVICES OR SYSTEMS WITH PRODUCT FUNCTIONAL SAFETY REQUIREMENTS; (B) AERONAUTIC APPLICATIONS; (C) AUTOMOTIVE APPLICATIONS OR ENVIRONMENTS, AND/OR (D) AEROSPACE APPLICATIONS OR ENVIRONMENTS. WHERE ST PRODUCTS ARE NOT DESIGNED FOR SUCH USE, THE PURCHASER SHALL USE PRODUCTS AT PURCHASER'S SOLE RISK, EVEN IF ST HAS BEEN INFORMED IN WRITING OF SUCH USAGE, UNLESS A PRODUCT IS EXPRESSLY DESIGNATED BY ST AS BEING INTENDED FOR "AUTOMOTIVE, AUTOMOTIVE SAFETY OR MEDICAL" INDUSTRY DOMAINS ACCORDING TO ST PRODUCT DESIGN SPECIFICATIONS. PRODUCTS FORMALLY ESCC, QML OR JAN QUALIFIED ARE DEEMED SUITABLE FOR USE IN AEROSPACE BY THE CORRESPONDING GOVERNMENTAL AGENCY.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.

ST and the ST logo are trademarks or registered trademarks of ST in various countries.

Information in this document supersedes and replaces all information previously supplied.

The ST logo is a registered trademark of STMicroelectronics. All other names are the property of their respective owners.
