Nessus Agent 8.0.0 Security Target, Version 1.0	04 December 2020
Table 7: Security Functions vs. Requirements Mapping	34

# 1 Security Target Introduction

The Security Target (ST) contains the following additional sections:

- Product and TOE Description (Section 2)
- Security Problem Definition (Section 3)
- Security Objectives (Section 4)
- IT Security Requirements (Section 5)
- •
- The TLS Package does contain evaluation activities for how to evaluate its SFR claims as part of
  the evaluation of ASE\_TSS.1, AGD\_OPE.1, AGD\_PRE.1, and ATE\_IND.1. All Security Functional
  Requirements specified by the TLS Package will be evaluated in the manner specified in that
  package.

Page 1 of 41

- TOE Summary Specification (Section 0)
- •

- Protection Profile Claims (Section 0)
- This ST is conformant to the *Protection Profile for Application Software, Version 1.3, 1 March 2019* (App PP) and *Functional Package for Transport Layer Security (TLS), Version 1.1, February 12, 2019* (TLS Package) along with all applicable errata and interpretations from the certificate issuing scheme.

The TOE consists of a software application that runs on a Linux operating system as its platform.

As explained in section 3, Security Problem Definition, the Security Problem Definition of the App PP has been included by reference into this ST.

As explained in section 4, Security Objectives, the Security Objectives of the App PP has been included by reference into this ST.

All claimed SFRs are defined in the App PP and TLS Package. All mandatory SFRs are claimed. No optional or objective SFRs are claimed. Selection-based SFR claims are consistent with the selections made in the mandatory SFRs that prompt their inclusion.

- Rationale (Section 0)
- TOE Usage of Third-Party Components (Appendix A)

# 1.1 Security Target, TOE and CC Identification

ST Title - Nessus Agent 8.0.0 Security Target

ST Version - Version 1.0

ST Date - 04 December 2020

TOE Identification - Nessus Agent 8.0.0, supported on RHEL 7 and Windows Server 2016

**TOE Developer** – Tenable, Inc.

**Evaluation Sponsor** – Tenable, Inc.

**CC Identification** – Common Criteria for Information Technology Security Evaluation, Version 3.1, Revision 5, April 2017

#### 1.2 Conformance Claims

This ST and the TOE it describes are conformant to the following CC specifications:

- Protection Profile for Application Software, Version 1.3, 01 March 2019 (App PP) with the following optional and selection-based SFRs:
  - FCS\_CKM.1(1)
  - o FCS\_CKM.2
  - o FCS COP.1(1)
  - FCS\_COP.1(2)
  - o FCS COP.1(3)
  - FCS\_COP.1(4)
  - FCS HTTPS EXT.1/Client (as specified in NIAP TD0473)
  - o FCS RBG EXT.2
  - o FIA X509 EXT.1
  - FIA\_X509\_EXT.2
- Functional Package for Transport Layer Security (TLS), Version 1.1, February 12, 2019 (TLS Package) with the following optional and selection-based SFRs:
  - o FCS\_TLSC\_EXT.1
  - o FCS\_TLSC\_EXT.5
- The following NIAP Technical Decisions apply to the TOE and have been accounted for in the ST development and the conduct of the evaluation, or were considered to be non-applicable:

#### TD0416: Correction to FCS\_RBG\_EXT.1 Test Activity

No change to ST; affects only test evaluation activities.

#### **TD0427: Reliable Time Source**

 No change to ST; the ST includes the PP's assumptions by reference and therefore any changes to the assumptions are implicitly made.

#### **TD0434: Windows Desktop Applications Test**

No change to ST; affects only evaluation activities.

#### TD0435: Alternative to SELinux for FPT\_AEX\_EXT.1.3

No change to ST; affects only evaluation activities.

#### **TD0437: Supported Configuration Mechanism**

Changes text selection for FMT\_MEC\_EXT.1.1. This change has been applied to this ST.

#### **TD0442: Updated TLS Ciphersuites for TLS Package**

No change to ST; affects selections in FCS\_TLSC\_EXT.1 that are not applicable to the TOE.

#### **TD0444: IPsec Selections**

No change to ST; affects selections in FTP\_DIT\_EXT.1.1 that are not applicable to the TOE.

#### **TD0445: User Modifiable File Definition**

 No change to ST; affects the evaluation of FPT\_AEX\_EXT.1 for the Windows platform version of the TOE.

#### **TD0465: Configuration Storage for .NET Apps**

No change to ST; the TD modifies evaluation activities only.

# TD0469: Modification of test activity for FCS\_TLSS\_EXT.1.1 test 4.1

N/A; the TOE does not claim TLS server functionality.

#### TD0473: Support for Client or Server TOEs in FCS\_HTTPS\_EXT

Changes FCS\_HTTPS\_EXT.1. This change has been applied to the ST.

#### TD0486: Removal of PP-Module for VPN Clients from allowed-with list

 N/A; the TOE does not have VPN Client functionality so no attempt was made to claim the VPN Client PP-Module. This TD modifies selections in FDP\_DAR\_EXT.1.1, but the ST does not choose any of the modified selections so there is no change to the SFR.

#### TD0498: Application Software PP Security Objectives and Requirements Rationale

No change to ST; the TD modified portions of the App PP that were not reproduced in the ST.

#### **TD0499: Testing with pinned certificates**

 No change to ST; affects only evaluation activities. Additionally, the TOE does not support pinned certificates.

#### TD0510: Obtaining random bytes for iOS/macOS

N/A; the TOE does not use iOS or macOS as its platform.

#### **TD0513: CA Certificate loading**

No change to ST; affects only evaluation activities.

#### TD0515: Use Android APK manifest in test

N/A; the TOE does not include an Android platform version.

#### TD0519: Linux symbolic links and FMT\_CFG\_EXT.1

o No change to ST; affects only evaluation activities.

# TD0521: Updates to Certificate Revocation (FIA\_X509\_EXT.1)

 Changes FIA\_X509\_EXT.1.1. This change has been applied to the ST. Note that the TD also added selections to FIA\_X509\_EXT.1.1. However, none of these added selections were applicable to the TOE and were therefore not selected.

#### TD0540: Expanded AES Modes in FCS COP

No change to ST; affects selections in FCS COP.1(1) that are not applicable to the TOE.

#### TD0543: FMT\_MEC\_EXT.1 evaluation activity update

No change to ST; affects only evaluation activities.

#### TD0544: Alternative testing methods for FPT\_AEX\_EXT.1.1

No change to ST; affects only evaluation activities.

# TD0548: Integrity for installation tests in AppSW PP 1.3

No change to ST; affects only evaluation activities.

#### TD0554: iOS/iPadOS/Android AppSW Virus Scan

- No change to ST; affects only evaluation activities.
- Common Criteria for Information Technology Security Evaluation Part 2: Security functional components, Version 3.1, Revision 5, April 2017.
  - o Part 2 Extended
- Common Criteria for Information Technology Security Evaluation Part 3: Security assurance components, Version 3.1 Revision 5, April 2017.
  - o Part 3 Extended

#### 1.3 Conventions

The following conventions have been applied in this document:

- Security Functional Requirements Part 2 of the CC defines the approved set of operations that may be applied to functional requirements: iteration, assignment, selection, and refinement.
  - o Iteration: allows a component to be used more than once with varying operations. An iterated SFR is indicated by a number in parentheses placed at the end of the component. For example, FCS\_COP.1(1) through FCS\_COP.1(4) indicate that the ST includes four iterations of the FCS\_COP.1 requirement: (1), (2), (3), and (4).
  - Assignment: allows the specification of an identified parameter. Assignments are indicated using italics and are surrounded by brackets (e.g., [assignment item]). Note that an

- assignment within a selection would be identified in both italics and underline, with the brackets themselves underlined since they are explicitly part of the selection text, unlike the brackets around the selection itself (e.g., [selection item, [assignment item inside selection]]).
- Selection: allows the specification of one or more elements from a list. Selections are indicated using underlines and are surrounded by brackets (e.g., [selection item]).
- Refinement: allows technical changes to a requirement to make it more restrictive and allows non-technical changes to grammar and formatting. Refinements are indicated using bold, for additions, and strike-through, for deletions (e.g., "... all objects ..." or "... some big things ..."). Note that minor grammatical changes that do not involve the addition or removal of entire words (e.g., for consistency of quantity such as changing "meets" to "meet") do not have formatting applied.
- Other sections of the ST Other sections of the ST use bolding to highlight text of special interest, such as captions.
- The ST does not show operations that have been completed by the PP authors, though it does preserve brackets to show where such operations have been made.

# 1.3.1 Terminology

The following terms and abbreviations are used in this ST:

Term	Definition	
Log Correlation Engine	An environmental component that is responsible for collecting log data from a variety of sources and aggregating it into a single collection of results.	
Nessus Agent	The TOE; an application that is installed on an endpoint system to collect details about that system's configuration and behavior.	
Nessus Network Monitor	An environmental component that collects and analyzes raw network traffic.	
Nessus/Nessus Manager	An environmental component that conducts remote scans of systems to collect data about their configuration and behavior and is used to deploy and collect data from the TOE.	
Platform	A general-purpose computer on which the TOE is installed.	
Scan	The process by which the TOE actively collects data from a target system.	
Tenable.sc (SecurityCenter)	An environmental component that functions as a centralized aggregator for data collected by the TOE and by other environmental components.

TOE	Target of Evaluation
TSF	TOE Security Function

# 2 Product and TOE Description

#### 2.1 Introduction

Nessus Agent 8.0.0 (Nessus Agent) is a software product that is designed to be installed on an endpoint system to facilitate local scanning of that system. Local scanning allows Nessus Agent to collect detailed information about the system's hardware, software, and configuration, which can be used to determine compliance with organizational security policies and whether potential exploitable vulnerabilities are present on that system.

Nessus Agent is deployed and configured by an environmental instance of Nessus Manager, which also collects scan results from Nessus Agent for aggregation and analysis. Nessus Manager in turn will transmit this data to an environmental instance of Tenable.sc (SecurityCenter), where it can be combined with network traffic and system log data to provide a comprehensive window into the security posture of an organization.

The TOE conforms to the App PP and TLS Package. As such, the security-relevant functionality of the product is limited to the claimed requirements in those standards. The security-relevant functionality is described in sections 2.3 and 2.4. The product overview in section 2.2 below is intended to provide the reader with an overall summary of the entire product so that its intended usage is clear. The subset of the product functionality that is within the evaluation scope is subsequently described in the sections that follow it.

#### 2.2 Product Overview

Nessus Agent is a vulnerability management product that is designed to provide visibility into system assets. The product is used to collect data from endpoint systems in an organization (e.g. Windows and Linux workstations). Nessus Agent complements the functionality of Nessus Manager, which can perform remote scanning of these systems, by collecting more detailed data that local access is required to obtain. Nessus Manager is responsible for the distribution and configuration of the various instances of Nessus Agent that may be present in an organization's environment. Nessus Agent will transmit its completed scan results to the environmental instance of Nessus Manager that configured it. This data can be used by Nessus Manager and by Tenable.sc to analyze the potential vulnerabilities of specific systems or to diagnose patterns that are applicable to multiple systems.

Nessus Agent also supports plugins, which can be downloaded and added to the product to detect specific vulnerabilities.

#### 2.3 TOE Overview

The Target of Evaluation (TOE) for Nessus Agent consists of the mandatory functionality prescribed by the App PP and TLS Package, as well as some selection-based functionality where needed.

The logical boundary is summarized in section 2.4.2 below. In general, the following Nessus Agent capabilities are considered to be within the scope of the TOE:

- Protection of sensitive data at rest: the TOE uses encryption to protect sensitive data.
- **Protection of data in transit:** the TOE secures data in transit between itself and its operational environment using TLS and HTTPS.

Page 10 of 41

- Trusted updates: the TOE provides visibility into its current running version and the vendor
  distributes updates to it that are digitally signed so that administrators can securely maintain upto-date software.
- **Cryptographic services:** the TOE includes an implementation of OpenSSL with NIST-validated algorithm services that it uses to secure data at rest and in transit.
- **Secure interaction with operating system:** the TOE is designed to interact with underlying host operating system platforms in such a way that the TOE cannot be used as an attack vector to compromise an operating system.

The TOE's scanning and data collection capabilities are outside the scope of the TOE (aside from the trusted channel used to transmit the collected data), as is any other product behavior that is not described in the App PP or TLS Package. The content and execution of plugins is similarly excluded from the TOE, although they are discussed in the context of network communications because the TSF must use platform network resources to acquire them.

#### 2.4 TOE Architecture

The Nessus Agent TOE consists of the Nessus Agent application, which is a C application. The TOE has both Linux and Windows platform versions.

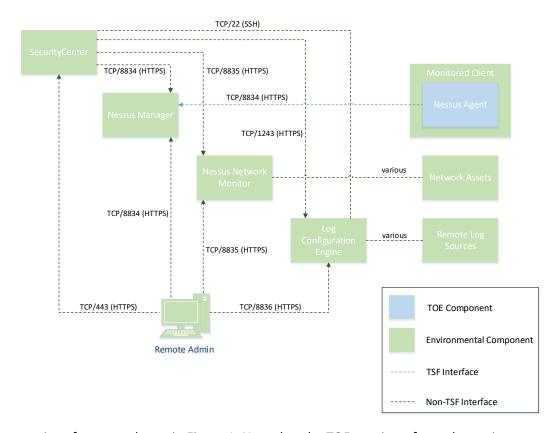

#### 2.4.1 Physical Boundary

The TOE consists of the following components, as shown in Figure 1 below:

Nessus Agent 8.0.0

Figure 1 shows the TOE in a sample deployment with other Tenable applications in its operational environment.

Figure 1 - TOE Boundary

TSF-relevant remote interfaces are shown in Figure 1. Note that the TOE consists of exactly one instance of Nessus Agent. However, it is expected that in a typical deployment, many instances of the Nessus Agent application will be deployed on organizational systems. This does not affect the security claims made by the TOE because there is no direct interface from one instance of Nessus Agent to another.

The TOE has the following system requirements for its host platform:

- 1x dual-core CPU (any dual-core CPU's clock speed is sufficient)
- under 1 GB RAM
- under 1 GB disk storage
- 15-50 IOPS disk speed

These system requirements reflect the lightest usage scenarios for the TOE. Additional factors such as network size and storage retention requirements will affect the system requirements for a particular deployment. Refer to the relevant TOE documentation (as referenced in section 2.5) for the specific system requirements that apply to a given deployment.

The following network port must be open for the TOE to function, but the specific port is configurable if the default port cannot be used:

TCP/8834 (for communications with Nessus Manager)

The TOE's operational environment includes the following:

- Other Tenable components (an instance of Nessus Manager Tenable.sc, Nessus Network Monitor, and Log Correlation Engine are expected to be present in the TOE's operational environment because they all contribute to the same overall capability but the TOE does not interact with these applications directly).
- Platform (hardware and software) on which the TOE is hosted.
  - The TOE is capable of running on a general-purpose Windows or Linux operating system on standard consumer-grade hardware on either a physical or virtual machine. For the evaluated configuration, the TOE was tested on virtualized instances of Windows Server 2016 and RHEL 7, each running on VMware ESXi 6.5 on a system using an AMD Ryzen Threadripper 1950X processor with the Zen microarchitecture.
- Full disk encryption is required for the TOE platform to ensure adequate data-at-rest protection.

#### 2.4.2 Logical Boundary

This section summarizes the security functions provided by the TOE:

- Timely Security Updates
- Cryptographic Support
- User Data Protection
- Identification and Authentication
- Security Management
- Privacy
- Protection of the TSF
- Trusted Path/Channels

#### 2.4.2.1 Timely Security Updates

The TOE developer has internal mechanisms for receiving reports of security flaws, tracking product vulnerabilities, and distributing software updates to customers in a timely manner.

#### 2.4.2.2 Cryptographic Support

The TOE implements cryptography to protect data in transit. The TOE does not store credential data on the local system so no separate data at rest protection mechanism is implemented.

For data in transit, the TOE implements TLS/HTTPS as a client to communicate with an instance of Nessus Manager in the operational environment. The TOE's TLS client does not support mutual authentication.

The TOE implements all cryptography used for this function using its own implementations of OpenSSL with NIST-approved algorithms. The TOE's DRBG is seeded using entropy from the underlying OS platform.

#### 2.4.2.3 User Data Protection

The TOE is compatible with the use of platform full disk encryption to protect sensitive data at rest.

The TOE relies on the network connectivity and system log capabilities of its host OS platform. The TOE supports application-initiated uses of the network. The TOE also access various system resources as part of conducting system scans. Specifically, the TOE supports local scanning of the system that it is installed on.

#### 2.4.2.4 Identification and Authentication

The TOE supports X.509 certificate validation as part of establishing TLS and HTTPS connections. The TOE supports various certificate validity checking methods and can also check certificate revocation status using OCSP. If the validity status of a certificate cannot be determined, the certificate will be accepted. All other cases where a certificate is found to be invalid will result in rejection without an administrative override.

## 2.4.2.5 Security Management

Both the TOE binary components themselves and the configuration settings they use are stored in locations recommended by the platform vendors.

The TOE does not include a direct user interface to manage its functionality. Security-relevant configuration of the TOE is initiated from the Nessus Manager application in the TOE's operational environment. This configuration relates to the circumstances under which the TOE will transmit data about the local system's hardware, software, and configuration information (i.e., scan results) back to its operational environment.

# 2.4.2.6 Privacy

The TOE does not handle personally identifiable information (PII) of any individuals.

#### 2.4.2.7 Protection of the TSF

The TOE enforces various mechanisms to prevent itself from being used as an attack vector to its host OS platform. Each TOE platform version (Windows and Linux) implements address space layout randomization (ASLR), does not allocate any memory with both write and execute permissions, does not write user-modifiable files to directories that contain executable files, is compiled using stack overflow protection, and is compatible with the security features of its host OS platform.

Each TOE platform version contains libraries and invokes system APIs that are well-known and explicitly identified.

The TOE has a mechanism to determine its current software version. Software updates to the TOE can be acquired by leveraging its OS platform or through its connection with the environmental Nessus Manager application. The format of the software update is dependent on the TOE platform version. All updates are digitally signed to guarantee their authenticity and integrity.

## 2.4.2.8 Trusted Path/Channels

The TOE encrypts sensitive data in transit between itself and its operational environment using TLS and HTTPS.

#### 2.5 TOE Documentation

Tenable provides the following product documentation in support of the installation and secure use of the TOE:

• Nessus Agent 8.0.x User Guide, Last Updated: October 29, 2020

# 3 Security Problem Definition

This ST includes by reference the Security Problem Definition, composed of threats and assumptions, from the App PP, including the inclusion of A.PLATFORM as required by TD0427. The Common Criteria also provides for organizational security policies to be part of a security problem definition, but no such policies are defined in the App PP.

As a functional package, the TLS Package does not contain a Security Problem Definition. The TOE's use of TLS is intended to mitigate the T.NETWORK\_ATTACK and T.NETWORK\_EAVESDROP threats defined by the App PP.

In general, the threat model of the App PP is designed to protect against the following:

- Disclosure of sensitive data at rest or in transit that the user has a reasonable expectation of security for.
- Excessive or poorly-implemented interfaces with the underlying platform that allow an application to be used as an intrusion point to a system.

This threat model is applicable to the TOE because aggregated and analyzed vulnerability scan results could show an attacker what system weaknesses are present in the environment if they were able to obtain this data. It is also applicable because the TOE is a collection of executable binaries that an attacker could attempt to use to compromise the underlying OS platform if it was designed in such a manner that this exploitation was possible.

Page 16 of 41

# 4 Security Objectives

Like the Security Problem Definition, this ST includes by reference the security objectives defined in the App PP. This includes security objectives for the TOE (used to mitigate threats) and for its operational environment (used to satisfy assumptions).

As a functional package, the TLS Package does not contain a Security Problem Definition. The TOE's use of TLS is intended to satisfy the O.PROTECTED\_COMMS objective of the App PP by implementing a specific method by which network communications are protected.

# 5 IT Security Requirements

This section defines the Security Functional Requirements (SFRs) and Security Assurance Requirements (SARs) that serve to represent the security functional claims for the Target of Evaluation (TOE) and to scope the evaluation effort.

The SFRs have all been drawn from the following Protection Profiles (PP) and Functional Packages:

- Protection Profile for Application Software, Version 1.3, March 1, 2019
- Functional Packages for Transport Layer Security (TLS), Version 1.1, February 12, 2019

As a result, any selection, assignment, or refinement operations already performed by that PP on the claimed SFRs are not identified here (i.e., they are not formatted in accordance with the conventions specified in section 1.3 of this ST). Formatting conventions are only applied on SFR text that was chosen at the ST author's discretion.

# 5.1 Extended Requirements

All of the extended requirements in this ST have been drawn from the App PP and TLS Package. These documents define the following extended SAR and extended SFRs; since they have not been redefined in this ST, the App PP and TLS Package should be consulted for more information regarding these extensions to CC Parts 2 and 3.

#### Defined in App PP:

- ALC\_TSU\_EXT.1 Timely Security Updates
- FCS\_CKM\_EXT.1 Cryptographic Key Generation Services
- FCS HTTPS EXT.1/Client HTTPS Protocol (as specified in NIAP TD0473)
- FCS RBG EXT.1 Random Bit Generation Services
- FCS\_RBG\_EXT.2 Random Bit Generation from Application
- FCS STO EXT.1 Storage of Credentials
- FDP\_DAR\_EXT.1 Encryption of Sensitive Application Data
- FDP DEC EXT.1 Access to Platform Resources
- FDP\_NET\_EXT.1 Network Communications
- FIA X509 EXT.1 X.509 Certificate Validation
- FIA\_X509\_EXT.2 X.509 Certificate Authentication
- FMT CFG EXT.1 Secure by Default Configuration
- FMT\_MEC\_EXT.1 Supported Configuration Mechanism
- FPR ANO EXT.1 User Consent for Transmission of Personally Identifiable Information
- FPT\_AEX\_EXT.1 Anti-Exploitation Capabilities
- FPT API EXT.1 Use of Supported Services and APIs
- FPT IDV EXT.1 Software Identification and Versions
- FPT\_LIB\_EXT.1 Use of Third Party Libraries
- FPT\_TUD\_EXT.1 Integrity for Installation and Update
- FPT\_TUD\_EXT.2 Integrity for Installation and Update
- FTP DIT EXT.1 Protection of Data in Transit

#### Defined in TLS Package:

FCS\_TLS\_EXT.1 TLS Protocol

- FCS\_TLSC\_EXT.1 TLS Client Protocol
- FCS\_TLSC\_EXT.5 TLS Client Support for Supported Groups Extension

# 5.2 TOE Security Functional Requirements

The following table identifies the SFRs that are satisfied by the TOE.

Table 3: TOE Security Functional Components

Requirement Class	Requirement Component	
FCS: Cryptographic Support	FCS_CKM.1(1) Cryptographic Asymmetric Key Generation	
	FCS_CKM.2 Cryptographic Key Establishment	
	FCS_CKM_EXT.1 Cryptographic Key Generation Services	
	FCS_COP.1(1) Cryptographic Operation – Encryption/Decryption

# 5.2.1 Cryptographic Support (FCS)

# 5.2.1.1 FCS CKM.1(1) Cryptographic Asymmetric Key Generation

## FCS\_CKM.1.1(1)

The application shall [

• implement functionality

] to generate asymmetric cryptographic keys in accordance with a specified cryptographic key generation algorithm [

• [ECC schemes] using ["NIST curves" P-256, P-384 and [no other curves]] that meet the following: [FIPS PUB 186-4, "Digital Signature Standard (DSS)", Appendix B.4]

].

# 5.2.1.2 FCS CKM.2 Cryptographic Key Establishment

#### FCS\_CKM.2.1

The application shall [implement functionality] to perform cryptographic key establishment in accordance with a specified cryptographic key establishment method: [

• [Elliptic curve-based key establishment schemes] that meet the following: [NIST Special Publication 800-56A, "Recommendation for Pair-Wise Key Establishment Schemes Using Discrete Logarithm Cryptography"]

].

# 5.2.1.3 FCS\_CKM\_EXT.1 Cryptographic Key Generation Services

#### FCS CKM EXT.1.1

The application shall [

• <u>Implement asymmetric key generation</u>

1.

# 5.2.1.4 FCS COP.1(1) Cryptographic Operation – Encryption/Decryption

#### FCS COP.1.1(1)<sup>1</sup>

The application shall perform encryption/decryption in accordance with a specified cryptographic algorithm [

- AES-CBC (as defined in NIST SP 800-38A) mode,
- AES-GCM (as defined in NIST SP 800-38D) mode

] and cryptographic key sizes [128-bit, 256-bit].

<sup>1</sup> This SFR is modified by TD0543 but this ST does not claim any of the selections that were added by the TD.

Page 20 of 41

# 5.2.1.5 FCS COP.1(2) Cryptographic Operation – Hashing

## FCS\_COP.1.1(2)

The application shall perform cryptographic hashing services in accordance with a specified cryptographic algorithm [

- SHA-256,
- SHA-384

] and message digest sizes [

- 256,
- 384

] bits that meet the following: FIPS Pub 180-4.

## 5.2.1.6 FCS COP.1(3) Cryptographic Operation – Signing

## FCS\_COP.1.1(3)

The application shall perform cryptographic signature services (generation and verification) in accordance with a specified cryptographic algorithm [

• RSA schemes using cryptographic key sizes of 2048-bit or greater that meet the following: FIPS PUB 186-4, "Digital Signature Standard (DSS)", Section 4

].

# 5.2.1.7 FCS\_COP.1(4) Cryptographic Operation – Keyed-Hash Message Authentication

# FCS\_COP.1.1(4)

The application shall perform keyed-hash message authentication in accordance with a specified cryptographic algorithm

• HMAC-SHA-256

and [

SHA-384

] with key sizes [256 bits, 384 bits] and message digest sizes 256 and [384] bits that meet the following: FIPS Pub 198-1 The Keyed-Hash Message Authentication Code and FIPS Pub 180-4 Secure Hash Standard.

# 5.2.1.8 FCS\_HTTPS\_EXT.1/Client HTTPS Protocol<sup>2</sup>

FCS\_HTTPS\_EXT.1.1/Client The application shall implement the HTTPS protocol that complies with RFC 2818.

FCS\_HTTPS\_EXT.1.2/Client The application shall implement HTTPS using TLS as defined in the TLS package.

**FCS\_HTTPS\_EXT.1.3/Client** The application shall [not establish the application-initiated connection] if the peer certificate is deemed invalid.

Page 21 of 41

<sup>&</sup>lt;sup>2</sup> As specified in NIAP TD0473.

# 5.2.1.9 FCS RBG EXT.1 Random Bit Generation Services

#### FCS\_RBG\_EXT.1.1 The application shall [

implement DRBG functionality

] for its cryptographic operations.

#### 5.2.1.10 FCS RBG EXT.2 Random Bit Generation from Application

FCS\_RBG\_EXT.2.1

The application shall perform all deterministic random bit generation (DRBG) services in accordance with NIST Special Publication 800-90A using [CTR\_DRBG (AES)].

FCS\_RBG\_EXT.2.2

The deterministic RBG shall be seeded by an entropy source that accumulates entropy from a platform-based DRBG and [

• no other noise source

] with a minimum of [

256 bits

] of entropy at least equal to the greatest security strength (according to NIST SP 800-57) of the keys and hashes that it will generate.

# 5.2.1.11 FCS\_STO\_EXT.1 Storage of Credentials

FCS\_STO\_EXT.1.1

The application shall [

not store any credentials

] to non-volatile memory.

## 5.2.1.12 FCS TLS EXT.1 TLS Protocol (TLS Package)

FCS\_TLS\_EXT.1.1

The product shall implement [

TLS as a client,

1.

## 5.2.1.13 FCS TLSC EXT.1 TLS Client Protocol (TLS Package)

FCS\_TLSC\_EXT.1.1<sup>3</sup>

The product shall implement TLS 1.2 (RFC 5246) and [no earlier TLS versions] as a client that supports the cipher suites [

- TLS ECDHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5289,
- TLS\_ECDHE\_RSA\_WITH\_AES\_128\_GCM\_SHA256 as defined in RFC 5289,
- TLS ECDHE RSA WITH AES 256 CBC SHA384 as defined in RFC 5289,
- TLS ECDHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5289]

Page 22 of 41

<sup>&</sup>lt;sup>3</sup> This SFR is modified by TD0442 but this ST does not claim any of the selections that were added by the TD.

and also supports functionality for [

• <u>none</u>

1.

FCS\_TLSC\_EXT.1.2

The product shall verify that the presented identifier matches the reference identifier according to RFC 6125.

FCS\_TLSC\_EXT.1.3

The product shall not establish a trusted channel if the server certificate is invalid [

• with no exceptions

].

# 5.2.1.14 FCS\_TLSC\_EXT.5 TLS Client Support for Supported Groups Extension (TLS Package)

**FCS\_TLSC\_EXT.5.1** The product shall present the Supported Groups Extension in the Client Hello with the supported groups [

- secp256r1,
- <u>secp384r1</u>].

# 5.2.2 User Data Protection (FDP)

# 5.2.2.1 FDP\_DAR\_EXT.1 Encryption of Sensitive Application Data

**FDP\_DAR\_EXT.1.1**<sup>4</sup> The application shall [

• leverage platform-provided functionality to encrypt sensitive data

] in non-volatile memory.

# 5.2.2.2 FDP\_DEC\_EXT.1 Access to Platform Resources

**FDP DEC EXT.1.1** The application shall restrict its access to [

• network connectivity

].

FDP\_DEC\_EXT.1.2

The application shall restrict its access to [

• [system configuration]

].

<sup>4</sup> This SFR is modified by TD0486 but this ST does not claim any of the selections that were added by the TD.

# 5.2.2.3 FDP\_NET\_EXT.1 Network Communications

# **FDP\_NET\_EXT.1.1** The application shall restrict network communication to [

- [application-initiated network communication for
  - o <u>transmission of scan results to Nessus Manager</u>,
  - o <u>periodic polling of Nessus Manager to determine if scan needs to be</u> initiated or if binary/plugin updates need to be acquired,
  - check for and download of binary and plugin updates from Nessus Manager

].

# 5.2.3 Identification and Authentication (FIA)

# 5.2.3.1 FIA X509 EXT.1 X.509 Certificate Validation

# FIA X509 EXT.1.1<sup>5</sup> The application shall [implemen

1<sup>5</sup> The application shall [implement functionality] to validate certificates in accordance with the following rules:

- RFC 5280 certificate validation and certificate path validation.
- The certificate path must terminate with a trusted CA certificate.
- The application shall validate a certificate path by ensuring the presence of the basicConstraints extension, that the CA flag is set to TRUE for all CA certificates, and that any path constraints are met.
- The application shall validate that any CA certificate includes caSigning purpose in the key usage field.
- The application shall validate the revocation status of the certificate using [the Online Certificate Status Protocol (OCSP) as specified in RFC 2560].
- The application shall validate the extendedKeyUsage (EKU) field according to the following rules:
  - Certificates used for trusted updates and executable code integrity verification shall have the Code Signing purpose (id-kp 3 with OID 1.3.6.1.5.5.7.3.3) in the extendedKeyUsage field.
  - Server certificates presented for TLS shall have the Server Authentication purpose (id-kp 1 with OID 1.3.6.1.5.5.7.3.1) in the extendedKeyUsage field.
  - Client certificates presented for TLS shall have the Client Authentication purpose (id-kp 2 with OID 1.3.6.1.5.5.7.3.2) in the extendedKeyUsage field.
  - S/MIME certificates presented for email encryption and signature shall have the Email Protection purpose (id-kp 4 with OID 1.3.6.1.5.5.7.3.4) in the extendedKeyUsage field.

Page 24 of 41

<sup>&</sup>lt;sup>5</sup> As specified in NIAP TD0521.

- OCSP certificates presented for OCSP responses shall have the OCSP Signing purpose (id-kp 9 with OID 1.3.6.1.5.5.7.3.9) in the extendedKevUsage field.
- Server certificates presented for EST shall have the CMC Registration Authority (RA) purpose (id-kp-cmcRA with OID 1.3.6.1.5.5.7.3.28) in the extendedKeyUsage field.

**FIA\_X509\_EXT.1.2** The application shall treat a certificate as a CA certificate only if the basicConstraints extension is present and the CA flag is set to TRUE.

# 5.2.3.2 FIA X509 EXT.2 X.509 Certificate Authentication

- **FIA\_X509\_EXT.2.1** The application shall use X.509v3 certificates as defined by RFC 5280 to support authentication for [HTTPS, TLS].
- **FIA\_X509\_EXT.2.2** When the application cannot establish a connection to determine the validity of a certificate, the application shall [accept the certificate].

# 5.2.4 Security Management (FMT)

# 5.2.4.1 FMT CFG EXT.1 Secure by Default Configuration

- **FMT\_CFG\_EXT.1.1** The application shall provide only enough functionality to set new credentials when configured with default credentials or no credentials.
- **FMT\_CFG\_EXT.1.2** The application shall be configured by default with file permissions which protect the application's binaries and data files from modification by normal unprivileged users.

# 5.2.4.2 FMT\_MEC\_EXT.1 Supported Configuration Mechanism

**FMT\_MEC\_EXT.1.1** The application shall [invoke the mechanisms recommended by the platform vendor for storing and setting configuration options].<sup>6</sup>

# 5.2.4.3 FMT SMF.1 Specification of Management Functions

**FMT\_SMF.1.1** The TSF shall be capable of performing the following management functions [

• <u>enable/disable the transmission of any information describing the system's hardware, software, or configuration</u>].

#### 5.2.5 Privacy (FPR)

5.2.5.1 FPR\_ANO\_EXT.1 User Consent for Transmission of Personally Identifiable Information

**FPR\_ANO\_EXT.1.1** The application shall [

not transmit PII over a network

Page 25 of 41

<sup>&</sup>lt;sup>6</sup> Modified from original App PP definition by TD0437

1.

# 5.2.6 Protection of the TSF (FPT)

#### 5.2.6.1 FPT AEX EXT.1 Anti-Exploitation Capabilities

**FPT\_AEX\_EXT.1.1** The application shall not request to map memory at an explicit address except for [no exceptions].

**FPT\_AEX\_EXT.1.2** The application shall [

not allocate any memory region with both write and execute permissions

1.

**FPT\_AEX\_EXT.1.3** The application shall be compatible with security features provided by the platform vendor.

**FPT\_AEX\_EXT.1.4** The application shall not write user-modifiable files to directories that contain executable files unless explicitly directed by the user to do so.

**FPT\_AEX\_EXT.1.5** The application shall be compiled with stack-based buffer overflow protection enabled.

# 5.2.6.2 FPT API EXT.1 Use of Supported Services and APIs

**FPT\_API\_EXT.1.1** The application shall use only documented platform APIs.

# 5.2.6.3 FPT\_IDV\_EXT.1 Software Identification and Versions

**FPT\_IDV\_EXT.1.1** The application shall be versioned with [[semantic versioning (SemVer)]].

## 5.2.6.4 FPT LIB EXT.1 Use of Third Party Libraries

**FPT\_LIB\_EXT.1.1** The application shall be packaged with only [third-party libraries listed in Appendix A.2].

**Application Note:** The TOE uses a large number of third-party libraries so this information has been provided in an Appendix for readability purposes.

# 5.2.6.5 FPT\_TUD\_EXT.1 Integrity for Installation and Update

**FPT\_TUD\_EXT.1.1** The application shall [leverage the platform] to check for updates and patches to the application software.

**Application Note:** The TOE may leverage the platform specifically to check for updates when communicating with the environmental Nessus Manager.

**FPT\_TUD\_EXT.1.2** The application shall [provide the ability, leverage the platform] to query the current version of the application software.

**FPT\_TUD\_EXT.1.3** The application shall not download, modify, replace, or update its own binary code.

**FPT\_TUD\_EXT.1.4** The application installation package and its updates shall be digitally signed such that its platform can cryptographically verify them prior to installation.

**FPT\_TUD\_EXT.1.5** The application is distributed [as an additional software package to the platform OS].

# 5.2.6.6 FPT\_TUD\_EXT.2 Integrity for Installation and Update

**FPT\_TUD\_EXT.2.1** The application shall be distributed using the format of the platform-supported package manager.

**FPT\_TUD\_EXT.2.2** The application shall be packaged such that its removal results in the deletion of all traces of the application, with the exception of configuration settings, output files, and audit/log events.

# 5.2.7 Trusted Path/Channels (FTP)

# 5.2.7.1 FTP\_DIT\_EXT.1 Protection of Data in Transit

# FTP\_DIT\_EXT.1.1 The application shall [

• encrypt all transmitted [sensitive data] with [HTTPS in accordance with FCS HTTPS EXT.1/Client, TLS as defined in the TLS Package]

] between itself and another trusted IT product.

# 5.3 TOE Security Assurance Requirements

The security assurance requirements for the TOE are included by reference to the App PP.

Requirement Class	Requirement Component	
ADV: Development	ADV_FSP.1 Basic Functional Specification	
AGD: Guidance Documentation	AGD_OPE.1 Operational User Guidance	
	AGD_PRE.1 Preparative Procedures	
ALC: Life-cycle Support	ALC_CMC.1 Labeling of the TOE	
	ALC_CMS.1 TOE CM coverage	
	ALC_TSU_EXT.1 Timely Security Updates	
ATE: Tests	ATE_IND.1 Independent Testing – Conformance	
AVA: Vulnerability Assessment	AVA_VAN.1 Vulnerability Survey	

*Table 4: Assurance Components* 

As a functional package, the TLS Package does not define its own SARs. The expectation is that all SARs required by the App PP will apply to the entire TOE, including the portions addressed by the TLS Package. Consequently, the evaluation activities specified in the App PP apply to the entire TOE evaluation, including any changes made to them by subsequent NIAP Technical Decisions as summarized in section 1.2 above.

The TLS Package does contain evaluation activities for how to evaluate its SFR claims as part of the evaluation of ASE\_TSS.1, AGD\_OPE.1, AGD\_PRE.1, and ATE\_IND.1. All Security Functional Requirements specified by the TLS Package will be evaluated in the manner specified in that package.

# 6 TOE Summary Specification

This chapter describes the security functions of the TOE:

- Timely Security Updates
- Cryptographic Support
- User Data Protection
- Identification and Authentication
- Security Management
- Privacy
- Protection of the TSF
- Trusted Path/Channels

#### 6.1 Timely Security Updates

Tenable supports a timely security update process for the TOE In addition to their own internal research, the product vendor supports disclosure of potential issues using community forums, direct engagement, and the Tenable support channel. For issues where there is a potential security concern, the support channel uses HTTPS for secure disclosure.

When an issue is reported, Tenable will determine its applicability to the product. The length of time needed to make this determination depends on the complexity of the issue and the extent to which it can be reproduced; well-documented issues such as exposure to a published CVE can be made quickly. If found to be a security issue, a patch is released within 30 days. Tenable monitors the third-party components used by the TOE for potential security issues as well. However, an issue with a dependent component may not be addressed if found not to be applicable to the TOE. For example, the issue may be in a library that is part of a larger package that the TOE uses, but the TOE does not include that specific library.

Security updates to the TOE are delivered as regular update packages in the same manner as a functional update. This process is described in section 6.7 below.

## 6.2 Cryptographic Support

The TOE uses cryptography to secure data in transit between itself and its operational environment.

All TOE cryptographic services are implemented by the OpenSSL cryptographic library. The TOE uses OpenSSL 1.1.1d. The cryptographic algorithms supplied by the TOE are NIST-validated. The following table identifies the cryptographic algorithms used by the TSF, the associated standards to which they conform, and the NIST certificates that demonstrate that the claimed conformance has been met.

Functions	Standards	Certificates	
FCS_CKM.1(1) Cryptographic Asymmetric Key Generation			
ECC key pair generation (NIST curves P-256, P-384)	FIPS PUB 186-4	CAVP cert # C1600	
FCS_CKM.2 Cryptographic Key Establishment			
ECDSA based key establishment	NIST SP 800-56A	CAVP cert # C1601	

Table 5: Cryptographic Functions

Functions	Standards	Certificates		
FCS_COP.1(1) Cryptographic Operation – Encryption/Decryption				
AES-CBC, AES-GCM (128, 256 bits)	CBC as defined in NIST SP 800- 38A	CAVP cert # C1600		
	GCM as defined in NIST SP 800- 38D			
FCS_COP.1(2) Cryptographic Operation – Ha	shing			
SHA-256 and SHA-384 (digest sizes 256 and 384 bits)	FIPS PUB 180-4	CAVP cert # C1600		
FCS_COP.1(3) Cryptographic Operation – Sig	ning			
RSA (2048-bit or greater)	FIPS PUB 186-4, Section 4	CAVP cert # C1600		
FCS_COP.1(4) Cryptographic Operation – Key	yed Hash Message Authentication			
HMAC-SHA-256 and SHA-384	FIPS PUB 198-1	CAVP cert # C1600		
	FIPS PUB 180-4			
FCS_RBG_EXT.2 Random Bit Generation from Application				
CTR_DRBG	NIST SP 800-90A	CAVP cert # C1600		
DRBG (256 bits)	NIST SP 800-57			

The TOE generates asymmetric keys in support of trusted communications. The TSF generates ECC keys using P-256 and P-384. These keys are generated in support of the ECDHE key establishment schemes that are used for TLS/HTTPS communications. To ensure sufficient key strength, the TOE also implements DRBG functionality for key generation, using the AES-CTR\_DRBG. The proprietary Entropy Analysis Report (EAR) describes how the TSF extracts random data from software-based sources to ensure that an amount of entropy that is at least equal to the strength of the generated keys is present (i.e., at least 256 bits when the largest supported keys are generated) when seeding the DRBG for key generation purposes. The Windows platform version of the TOE relies on a third-party entropy source provided by the platform vendor. The Linux platform version of the TOE relies on the OS platform entropy source as well. Specifically, random numbers are obtained from the following platform APIs, depending on the platform used:

- Windows: SystemPRNG
- Linux: invocation of /dev/random pseudo-device

In both cases, it is assumed that these platforms provide at least 256 bits of entropy.

The TOE uses TLS 1.2 for client communications. The TLS client implementations support the following TLS cipher suites in the TOE's evaluated configuration:

- TLS ECDHE RSA WITH AES 128 CBC SHA256
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_GCM\_SHA256
- TLS ECDHE RSA WITH AES 256 CBC SHA384
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_GCM\_SHA384

All supported ciphersuites use elliptic curves as the method of key establishment. The TSF presents secp256r1 and secp384r1 as the supported values in the Supported Groups extension and uses the same NIST curves for key establishment.

As part of certificate validation in the establishment of TLS connectivity, the TOE will validate the reference identifier of a presented server certificate. This is done through validation of the Common Name (CN) and Subject Alternative Name (SAN) certificate fields, the latter of which is expected to contain the FQDN of the external system that is presenting the certificate to the TOE. The reference identifier is established by configuration. IP addresses are not supported. Wildcards are only supported for the left-most label immediately preceding the public suffix. Certificate pinning is not supported. All digital signatures used for the establishment of TLS communications use 2048-bit RSA.

The TOE uses TLS client functionality for communications between the TOE and an instance of the Nessus Manager application in the operational environment. This communication does not use mutually-authenticated TLS. The TOE's implementation of HTTPS conforms to RFC 2818. The connection will be rejected if certificate validation fails.

The TOE does not store any credentials so no specific method of secure credential storage is implemented.

The Cryptographic Support security function is designed to satisfy the following security functional requirements:

- FCS\_CKM.1(1) The TOE uses a NIST-validated implementation to generate asymmetric keys in support of TLS communications.
- FCS\_CKM.2 The TOE performs NIST-validated key establishment in support of TLS communications.
- FCS\_CKM\_EXT.1 The TOE implements its own cryptographic functionality.
- FCS\_COP.1(1) The TOE uses a NIST-validated implementation to perform AES encryption and decryption in support of TLS communications.
- FCS\_COP.1(2) The TOE uses a NIST-validated implementation to perform cryptographic hashing in support of TLS communications.
- FCS\_COP.1(3) The TOE uses a NIST-validated implementation to generate and verify RSA digital signatures in support of TLS communications.
- FCS\_COP.1(4) The TOE uses a NIST-validated implementation to perform HMAC functions in support of TLS communications.
- FCS HTTPS EXT.1/Client The TOE implements HTTPS as a client to secure data in transit.
- FCS RBG EXT.1 The TOE implements its own random bit generation services.
- FCS\_RBG\_EXT.2 The TOE uses a NIST-validated implementation to generate pseudo-random bits and this implementation is seeded with sufficiently strong entropy collected from the operational environment.
- FCS\_STO\_EXT.1 The TOE does not store any credential data that requires cryptographic protection.
- FCS\_TLS\_EXT.1 The TOE implements TLS to secure data in transit.
- FCS\_TLSC\_EXT.1 The TOE implements TLS as a client.
- FCS\_TLSC\_EXT.5 The TOE's TLS client implementation presents supported elliptic curves to the server in the Supported Groups extension when an ECDHE cipher suites is negotiated.

#### 6.3 User Data Protection

The App PP defines 'sensitive data' as follows: "Sensitive data may include all user or enterprise data or may be specific application data such as emails, messaging, documents, calendar items, and contacts. Sensitive data must minimally include PII, credentials, and keys. Sensitive data shall be identified in the application's TSS by the ST author."

Based on this definition, the only sensitive data stored by the TOE is system scan results. This data is not maintained persistently on the platform because it is discarded after its transmission to the environmental Nessus Manager application. However, it may temporarily reside in local storage in the event of the TOE's inability to communicate with Nessus Manager.

In the evaluated configuration, the TOE will be installed on a platform that has full disk encryption enabled. All data at rest is ultimately secured by the operational environment's platform encryption functionality.

The underlying platform functionality that the TOE interacts with include network connectivity, system configuration, and system logs. The TOE uses network connectivity for connections to the environmental Nessus Manager application. The TOE accesses system configuration to collect data about the local system for subsequent analysis.

The TOE uses environmental network capabilities to communicate with the environmental Nessus Manager application in its operational environment. The following table highlights the TOE's network usage.

Component	User-Initiated	Externally-Initiated	TOE-Initiated
Nessus Agent	None	None	Transmission of scan results to Nessus Manager
			Periodic polling of Nessus Manager to determine if scan needs to be initiated or if binary/plugin updates need to be acquired
			Check for and download of binary and plugin updates from Nessus Manager

Table 6: TOE Network Usage

The User Data Protection security function is designed to satisfy the following security functional requirements:

- FDP\_DAR\_EXT.1 Sensitive data at rest is protected by full disk encryption of the TOE's underlying OS platform.
- FDP\_DEC\_EXT.1 The TOE's use of platform services is well understood by users prior to authorizing the TOE activity.
- FDP\_NET\_EXT.1 The TOE communicates over the network for well-defined purposes. The use of network resources is initiated by the TOE.

#### 6.4 Identification and Authentication

The TOE uses X.509 certificates for validation of the Nessus Manager TLS server certificate.

The TOE implements the following functional behavior for its usage of X.509 certificates:

- Certificate validation and certificate path validation is performed in accordance with RFC 5280.
- The certificate path is checked to ensure that it terminates with a trusted CA certificate.
- The certificate path is validated by ensuring the presence of the basicConstraints extension, that the CA flag is set to TRUE for all CA certificates, and that any path constraints are met.
- Any CA certificate is validated by ensuring that the key usage field includes the caSigning purpose.
- Revocation status is checked using OCSP in accordance with RFC 2560.
- The application shall validate the extendedKeyUsage field according to the following rules:
  - Certificates used for trusted updates and executable code integrity verification shall have the Code Signing purpose (id-kp 3 with OID 1.3.6.1.5.5.7.3.3) in the extendedKeyUsage field.
  - Server certificates presented for TLS shall have the Server Authentication purpose (id-kp 1 with OID 1.3.6.1.5.5.7.3.1) in the extendedKeyUsage field.
  - Client certificates presented for TLS shall have the Client Authentication purpose (id-kp 2 with OID 1.3.6.1.5.5.7.3.2) in the extendedKeyUsage field.
  - o S/MIME certificates presented for email encryption and signature shall have the Email Protection purpose (id-kp 4 with OID 1.3.6.1.5.5.7.3.4) in the extendedKeyUsage field.

In the event that the revocation status of a certificate cannot be verified (i.e. the OCSP responder cannot be reached), the TOE will accept the certificate.

Because the TOE's use of the certificate validation function is to validate the authenticity of remote endpoints, the TSF chooses what certificates to use based on what is presented to it as part of establishing the TLS session. The TOE is only assigned one certificate for its own use, so there is only one certificate that it will present in cases where a remote entity may need to validate it.

The Identification and Authentication security function is designed to satisfy the following security functional requirements:

- FIA\_X509\_EXT.1 X.509 certificates are validated by the TSF when establishing trusted communications.
- FIA\_X509\_EXT.2 X.509 certificates are used for TLS. When revocation status of a certificate cannot be determined, the TSF accepts the certificate by default.

## 6.5 Security Management

The TOE does not provide a direct user interface for configuration of the TOE. All configuration is initiated from the operational environment, using an instance of Nessus Manager that is connected to the TOE.

The TOE is installed into the following location, depending on the platform version:

- Windows: C:\Program Files\Tenable\nessus\_agent
- Linux: /opt/nessus\_agent

All directories containing TOE software and data are configured by default in such a manner that nothing is world-writable on Linux and Administrator privileges are required to access them on Windows. Configuration settings that affect the TOE's interaction with the host OS platform are stored in /etc for Linux and the Windows Registry for Windows.

The TOE supports the following security-relevant management functions:

- Configuration of transmission of system's hardware, software, or configuration information
  - Conducts system scans of local systems. The environmental Nessus Manager can be used to manually initiate a scan or to define a schedule that causes the TOE to initiate scanning at the specified times and intervals.

The Security Management security function is designed to satisfy the following security functional requirements:

- FMT\_CFG\_EXT.1 The TOE does not include functionality that uses administrative credentials. The TOE is protected from direct modification by untrusted users via their host OS platforms.
- FMT\_MEC\_EXT.1 Configuration settings for the TOE are stored in appropriate locations for each supported host OS platform.
- FMT\_SMF.1 Administrators can use an environmental application to configure the collection of system data from the TOE's operational environment.

#### 6.6 Privacy

The TOE's primary function is to examine an organizational asset for configuration or operational states that may indicate the presence of a vulnerability or misuse of organizational resources. To this end, the TOE transmits data about system configuration to its operational environment for aggregation, analysis, and reporting. The TOE is not responsible for the collection or transmission of PII.

The Privacy security function is designed to satisfy the following security functional requirements:

FPR\_ANO\_EXT.1 – The TOE prevents the unnoticed/unauthorized transmission of PII across a
network by not having functionality that is intended for such transmissions.

#### 6.7 Protection of the TSF

The TOE implements several mechanisms to protect against exploitation. The TOE implements address space layout randomization (ASLR) through the use of the /DYNAMICBASE (Windows) and –fPIC (Linux) compiler flags and rely fully its underlying host platforms to perform memory mapping. The TOE also does not use both PROT\_WRITE and PROT\_EXEC on the same memory regions. There is no situation where the TSF maps memory to an explicit address. The TOE is written in C. The TOE is compiled with stack overflow protection whether it is intended for use on Linux or Windows. The Linux platform version is compiled with –fstack-protector-strong and the Windows platform version is compiled with /GS.

Both platform versions of the TOE are designed to run on host OS platforms where platform security features have been enabled (e.g. Windows Defender Export Guard, SELinux enabled and enforcing). The TOE uses only documented platform APIs. Appendix A.1 lists the APIs used by the TOE. The TOE also makes use of third-party libraries. Appendix A.2 lists the libraries used by the TOE. The TOE is versioned using semver (Semantic Versioning) in the format x.y(.z) where x is the major version, y is the minor version, and the optional z is the patch version; SWID is not used. The TOE is a standalone application that is not natively bundled as part of a host OS.

The TOE can identify its current running versions through both platform and TSF-mediated methods. The Linux platform version of the TOE is installed as an RPM and will identify its version in RPM itself. The TOE will also return its version information if its binary is invoked with the —v flag on the OS platform regardless

of which platform version it is. An administrator can also check the version of the TOE using the environmental instance of Nessus Manager that is connected to the TOE to check the TOE's version.

The TOE can leverage its OS platform to check for software updates and acquire them if they are available. In this case, candidate updates are obtained by the administrator downloading them directly from Tenable's website or through a package manager such as yum. However, since a typical deployment may include a large number of Nessus Agent instances, it is also possible to leverage the Nessus Manager platform to obtain a software update for the TOE. The TOE can check for an available update when communicating with Nessus Manager. The candidate update is initially obtained from the operational environment via an administrator downloading it from Tenable's site, but the administrator is then able to place it on the environmental Nessus Manager so that the TOE obtain it from there. The TOE will not download, modify, replace, or update its own binary code. The TOE is packaged as an .rpm file for Linux and an .exe file for Windows. Each are digitally signed by Tenable using 2048-bit RSA. Removing (uninstalling) the product will remove all executable code from the host system.

The Protection of the TSF security function is designed to satisfy the following security functional requirements:

- FPT\_AEX\_EXT.1 The TOE interacts with its host OS platform in a manner that does not expose the system to memory-related exploitation.
- FPT\_API\_EXT.1 The TOE uses documented platform APIs.
- FPT\_IDV\_EXT. 1 The TOE is versioned using semver.
- FPT\_LIB\_EXT.1 The set of third-party libraries used by the TOE is well-defined.
- FPT\_TUD\_EXT.1 There is a well-defined method for checking what version of the TOE is currently installed and whether updates to it are available. Updates are signed by the vendor and validated by the host OS platform prior to installation.
- FPT TUD EXT.2 The TOE can be updated through installation packages.

#### 6.8 Trusted Path/Channels

In the evaluated configuration, the TOE uses both its own cryptographic implementation and its host OS platform to encrypt sensitive data in transit. Listed below is the external interface to the TOE that relies on trusted communications.

#### Between TOE and environmental Tenable components:

- Between Nessus Manager and TOE
  - Communications use TLS/HTTPS (TOE is client and Nessus Manager is server)
  - o Configurable TCP port, 8834 is default
  - Used by Nessus Manager to collect local scan results from the TOE

The Trusted Path/Channels security function is designed to satisfy the following security functional requirements:

• FTP\_DIT\_EXT.1 – The TOE relies on its own mechanisms to secure data in transit between itself and its operational environment.

# 7 Protection Profile Claims

This ST is conformant to the *Protection Profile for Application Software, Version 1.3, 1 March 2019* (App PP) and *Functional Package for Transport Layer Security (TLS), Version 1.1, February 12,* 2019 (TLS Package) along with all applicable errata and interpretations from the certificate issuing scheme.

The TOE consists of a software application that runs on a Linux operating system as its platform.

As explained in section 3, Security Problem Definition, the Security Problem Definition of the App PP has been included by reference into this ST.

As explained in section 4, Security Objectives, the Security Objectives of the App PP has been included by reference into this ST.

All claimed SFRs are defined in the App PP and TLS Package. All mandatory SFRs are claimed. No optional or objective SFRs are claimed. Selection-based SFR claims are consistent with the selections made in the mandatory SFRs that prompt their inclusion.

# 8 Rationale

This Security Target includes by reference the App PP Security Problem Definition, Security Objectives, and Security Assurance Requirements. The Security Target does not add, remove, or modify any of these items. Security Functional Requirements have been reproduced with the Protection Profile operations completed. All selections, assignments, and refinements made on the claimed Security Functional Requirements have been performed in a manner that is consistent with what is permitted by the App PP and TLS Package. The proper set of selection-based requirements have been claimed based on the selections made in the mandatory requirements. Consequently, the claims made by this Security Target are sufficient to address the TOE's security problem. Rationale for the sufficiency of the TOE Summary Specification is provided below.

# 8.1 TOE Summary Specification Rationale

This section in conjunction with Section 0, the

The TLS Package does contain evaluation activities for how to evaluate its SFR claims as part of the evaluation of ASE\_TSS.1, AGD\_OPE.1, AGD\_PRE.1, and ATE\_IND.1. All Security Functional Requirements specified by the TLS Package will be evaluated in the manner specified in that package.

Page 37 of 41

TOE Summary Specification, provides evidence that the security functions meet the TOE security requirements. Each description includes rationale indicating which requirements the corresponding security functions satisfy. The combined security functions work together to satisfy all of the security requirements. The security functions described in Section 6 are necessary for the TSF to enforce the required security functionality. Table 7 demonstrates the relationship between security requirements and functions.

# Appendix A TOE Usage of Third-Party Components

This Appendix lists the platform APIs and third-party libraries that are used by the TOE.

#### A.1 Platform APIs

Listed below are the platform APIs used by the TOE. Note that these APIs do not necessarily relate to the TOE functionality claimed in the Security Target; however, since they are bundled with the product itself they are disclosed since a vulnerability in outside the logical boundary of the product could still present an exploitable vulnerability.

#### Windows:

CrtSetDbgFlag, heapmin, set invalid parameter handler, strtoi64, unix2windows 64, wtoi, wtoi64, accept, AllocateAndInitializeSid,bind, CheckTokenMembership, CloseHandle, CloseServiceHandle, closesocket, CoCreateInstance, CoInitializeEx, CoInitializeSecurity, CompareStringW,connect, ControlService, CoSetProxyBlanket, CoUninitialize, CreateEvent, CreateFile, CreateFileA, CreatePipe, CreateProcess, CreateService, CreateThread, CreateToolhelp32Snapshot,ctime\_s, DeleteFileA, DeleteService, EnterCriticalSection, EnumServicesStatus, FileTimeToSystemTime, FindClose, FindFirstFileA, FindNextFile, FormatMessage, FreeLibrary, FreeSid, GetComputerNameA, GetConsoleMode, GetCurrentProcess, GetCurrentProcessId, GetCurrentThreadId,getenv, GetExitCodeProcess, GetFileAttributes, GetFileSize, GetFileVersionInfoExW, GetFileVersionInfoSizeExW, GetLastError, GetModuleHandle, GetProcAddress, GetProcessHeap, GetProcessId, GetSecurityDescriptorControl, GetSecurityInfo, GetServiceDisplayNameA,getsockname, GetStdHandle, GetSystemTimeAsFileTime, GetTcpTable, GetTimeZoneInformation, GetUserName, GetVersionEx, GetWindowsDirectoryA, GlobalMemoryStatusEx, HeapAlloc, HeapFree, HeapLock, HeapReAlloc, HeapSetInformation, HeapUnlock, HeapWalk, htonl, htons, IEnumWbemClassObject Next, IEnumWbemClassObject Release, IsValidSecurityDescriptor, IsWindowsServer, IWbemCallResult GetCallStatus, IWbemCallResult GetResultObject, IWbemCallResult Release, IWbemClassObject BeginEnumeration, IWbemClassObject EndEnumeration, IWbemClassObject Get, IWbemClassObject GetMethod, IWbemClassObject Next, IWbemClassObject Put, IWbemClassObject QueryInterface, IWbemClassObject Release, IWbemClassObject SpawnInstance, IWbemLocator ConnectServer, IWbemLocator Release, IWbemServices AddRef, IWbemServices\_ExecMethod, IWbemServices\_ExecQuery, IWbemServices\_GetObject, IWbemServices Release, LeaveCriticalSection, listen, LoadLibrary, LocalFree, localtime s, LsaClose, LsaEnumerateAccountsWithUserRight, LsaFreeMemory, LsaLookupNames, LsaLookupSids, LsaOpenPolicy, LsaQueryDomainInformationPolicy, LsaQueryInformationPolicy,IstrlenW,memset, Module32First, Module32Next, MultiByteToWideChar, NetApiBufferFree, NetGroupGetUsers, NetLocalGroupGetMembers, NetServerEnum, NetServerGetInfo, NetSessionEnum, NetShareEnum, NetUserGetGroups, NetUserGetInfo, NetUserGetLocalGroups, NetUserModalsGet, NetWkstaGetInfo, NetWkstaUserEnum, OpenProcess, OpenSCManagerA, OpenService, PdhAddCounterA, PdhCollectQueryData, PdhOpenQueryA, poll, QueryServiceObjectSecurity, QueryServiceStatus, RaiseException, ReadConsole, ReadFile, recv, RegCloseKey, RegCreateKeyExA, RegEnumKeyA, RegEnumKeyExA, RegEnumValueA, RegGetKeySecurity, RegOpenKeyA, RegOpenKeyExA, RegQueryInfoKeyA, RegQueryValueExA, RegSetValueExA, SafeArrayAccessData, SafeArrayCreateVector, SafeArrayGetDim, SafeArrayGetLBound, SafeArrayGetUBound, SafeArrayUnaccessData,

Page 40 of 41

SamCloseHandle, SamConnect, SamFreeMemory, SamOpenDomain, SamQueryInformationDomain, saturate, send, SetConsoleCtrlHandler, SetConsoleMode, SetFilePointer, SetHandleInformation, SetLastError, setsockopt, SetStdHandle, SetUnhandledExceptionFilter, SHGetFolderPath, Sleep, socket, StackWalk64, StartService, SysAllocStringByteLen, SysAllocStringLen, SysFreeString, SysStringLen, SystemTimeToFileTime, SystemTimeToTzSpecificLocalTime, TerminateProcess, time, TzSpecificLocalTimeToSystemTime, VariantClear, VerQueryValueA, vsnprintf\_s, w32\_change\_privilege, WaitForSingleObject, WideCharToMultiByte, WriteFile, WSACleanup, WSAGetLastError, WSAStartup, ZeroMemory, GetAdaptersAddresses, GetAdaptersInfo, SHGetS(pecialFolderPath, Irand48, GetTickCount64, QueryPerformanceFrequency, QueryPerformanceCounter, GetTickCount, GetUserNameW, DnsQuery\_UTF8, DnsRecordListFree, SetPriorityClass, BCryptGenRandom

#### Linux:

#### Used by plugins:

cat, grep, echo, wc, find, ps, type, uname, ls, awk, sysinfo, sysctl, which, strings, head, echo, test, read, readlink, rm, chmod, od, tr, sh, cut, sort, tee, chown, do, while, if, hexdump, strcat, tail, sed, xargs, dd, netstat, ifconfig, ip, hostname

#### Used by plugins, to test specific platforms/applications:

init, unzip, nwmgr, lanscan, docker, cli, dhcpd, unzip, equery, xl, sqlite3, db2ls, db2level, db2, md5sum, sha2s6sum, sha1sum, yara, lsof, cmdagent, nails, sc, sc4, vmware-view, loginsight, bash, dmidecode, wget, curl, rpm, cfservd, prelink, netstat, rmsock, inpcb, proctree, service, dpkg, iptables, lsmod, openssl, splunk, namei, java, dd

#### **Used by Nessus bug report generator:**

uname, dmesg, tail, killall, sh, uptime, ls, ps, grep, xargs, netstat, arp, df, cat, tail, rpm, free, ifconfig, du, tar

## A.2 Third-Party Libraries

Listed below are the third-party libraries used by the TOE. Note that these libraries do not necessarily relate to the TOE functionality claimed in the Security Target; however, since they are bundled with the product itself they are disclosed since a vulnerability in outside the logical boundary of the product could still present an exploitable vulnerability.

Apache FOP, chart.js, DataTables, expat, Flatiron Director, Font Awesome, GLYPHICONS, Handlebars, jemalloc, jQuery, jQuery Cookie, jQuery FileUpload, jQuery HotKeys, jQuery scroll.To, jQuery tipsy, jQuery UI, JSONSL, less.js, libbzip2, libjpeg, libpcap, libpcre, libxml2, libxmlsec, libxslt, List.js, moment, OpenSSL, SEE, Select2, Snappy, snprintf.c, SQLite, Underscore, js, WinPCAP, ZIPVFS, zlib
